Yes, it is a Yaesu FT-200.

The Tempo One was manufactured by Yaesu as an FT-200, marketed in the U.S. as a Henry Radio Tempo One, and in Europe as a Sommerkamp FT-250.

19535. Re: [TS-520_820_530_830] Tempo One

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-01-01 00:25:47 UTC
From: Erwin Haynes
Topic: 19530 Message: 19535

Hi Jennifer:

I have recently acquired a batch (5) of Tempo Ones (FT200) - all in various degrees of tune/performance. To keep it short - the one I am making my "prime" unit is quite nice, and I have no particular issues with birdies at all - yes, it is not frequency stable for at least 30 minutes after firing it up, and it will never be even a very good transceiver -- but I have fun just playing around!

If I can help anymore, please contact off-line. I cannot say I am an expert by any means, in fact I am using theses radios as a way of "getting into the guts", e.g. taking apart, cleaning, testing and implementing mods I have found. That way if I mess up -- at least I did so with a cost-effective transceiver!

Regards & 73!

I ask this question once before, can anyone help me with some of the
problems with my Tempo One. I have a ham ticket, and getting no
help. Can anyone give me some ideas?

I need to know something, does the Tempo One have problems like
birdies and other things like lack of ears "Hearing signals" mine was
given to me. It's a piece of junk! Can't hear, and a lot of
birdies! Any ideas of what is the cause of this? Can tubes do this
or misalignments? Need some ideas!

Not to start a flame war or anything, and while I almost completely agree
that radio != internet, I don't have any 6m capability in my area, but I
do have a local 2m repeater set up as an IRLP node, and likewise have a
6m
repeater locally set up the same way. I have been known to cross-band by
linking those two nodes, and I'm still talking locally via radio to other
hams via radio... I'm just using a little scrap of the internet as a
transverter. ;)

But yeah, I agree with you that radio means radio.

In this particular case, however, it was an invitation to an online group
helping people get started in ham radio. I think that's a great thing,
very
encouraging for our service, and who says you can only learn about radio ON

the radio? Heck, you're posting to an internet group about radio issues
right now... Does that make you any less of a "true ham" than someone who
refuses to get online at all? Personally, I think Amateur radio is about
communication and about learning, and we can certainlydo a lot of both
online! In fact, that's a lot of the reason I think so many hams ARE
online -- the same reasons, in many cases, that they are hams.

My $0.02, and please take this soapbox away from me. ;)

Thanks!

I have the schematic. By looking at that I think I've somewhat figured out how to connect it for receive. I've been watching a QSO on 3582.3 concerning the year of astronomy with digipan - though propagation at my QTH appears to be changing. I've not figured out how to transmit though.

Anyone else successfully interfaced the PC-1 with a PC and using it for PSK31?

Jennifer, The problem is called lack of receiver sensitivity. What are you using for an antenna? Has this radio been modified? Yes, tubes and lousy workmanship can cause your issue. Do you have any test gear, repair manual.. ? You will need some basic test gear to even get started. Most of what you said here is "CB" lingo and I highly suspect this radio, as the tempo one is a favorite to modify for out of band use. See if you can find a history on this radio. That may tell you how bad or how good any mods were done. Brad KB2CHY

I just picked up an HP Spectrum Analyzer.
Nice Unit, but need to figure out how to use it.
Anyone have helpful tips out there?
It is an HP-141 unit with the 8553B RF Unit and the 85552B IF unit. It
was Calibrated just before being shipped to me the day before Christmas.
I have the Manuals, now to Learn.. hi hi..
This is my first Spectrum Analyzer, so looking for advice and hints.
I'm good with the Scope, Frequency generators, Frequency
counters,meters and that sort of stuff.
73,
Gordon

make sure you read them, ask a local ham for help, if any have used one
before, then read the manual some more

19545. Intermittant RF output and alc indication

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-01-02 14:26:00 UTC
From: alw8oc
Topic: 19545 Message: 19545

Hi folks, here's another problem that I could use some help with. I have a 7 million series 830S with relatively new driver and finals installed. Periodically, when I turn the rig on, I am unable to get get more than a few watts out in either ssb or cw modes. This occurs on all bands, an doesn't seem to be related to a bandswitch issue. I've also noticed that when the processor is engaged, I don't get an alc reading on the meter. I can rectify the output issue by moving the sg switch back and forth, once or twice, but that does not restore the missing alc indication on the meter. The rig's receiver works perfectly and I get good reports on ssb and cw transmissions. I've cleaned all of the pots, tapped or wiggled all of the plugs and connecting cables on the circuit boards, etc. to no avail. Only moving the sg switch brings transmit back to life. Oh, also, I've replaced the sg switch..... I wonder if anyone else has ever experienced this problem? Could it be a dirty or sticking relay? Any assistance would be appreciated. Thanks as always. Al - W8OC.

Al,

"Intermittent" ALC? Are you saying that your 830 does not ALWAYS show an ALC meter reading while you are operating normal sideband when speaking into the microphone but on occasions it does? If this is true than there's nothing wrong with your 830.

First, there's no reason you should ALWAYS see an ALC meter indication during normal sideband operation.

For some reason there seems to be a belief that if the ALC meter does not ALWAYS show a meter reading there is something wrong with the transmitter. This is simply NOT TRUE! To understand why this is, one needs to understand what ALC is, how it is creates, and what it is used for.

ALC is created when "grid current" flows in the final amplifier tubes. The Kenwood hybrid final amplifiers, 520, 530, 820, and 830, along with many other sideband transceivers, operate in Class AB1. A Class AB1 amplifier does not normally have grid current. This means a Class AB1 amplifier grids are always "Negative". However, when a Class AB1 amplifier grid becomes "positive" due to excessive drive, a current begins to flow between the amplifier tube's Cathode and Grid. When grid current flows in a Class AB1 amplifier, the amplifier is no longer operating in a "linear" state, resulting in "distortion" in the amplifier's output signal.

The final amplifier's in many class AB1 RF amplifiers have an ALC circuit. When grid current flows due to excessive drive to the final amplifier grids, the ALC circuit rectifies the voltage created by the grid current. This voltage is fed back to the "IF UNIT" (IF amplifier) to "reduce" the IF UNIT's (IF amplifier) gain. "IF" the ALC voltage is the same or less than the normal IF UNIT's operating voltage then the IF UNIT's gain remains "Unchanged". However, "IF" the ALC voltage is greater than the IF UNIT's normal operating voltage then the gain of the IF UNIT (IF amplifier) is "reduced" which leads to reduction in the final amplifier's output. The ALC voltage is used to reduce destortion due to excessive drive to the final amplifier causing the final tube grids to go "positive" when they should be "negative" under normal operation which results in the final amplifier to return to a "linear state".

So, if you do not ALWAYS see an ALC meter indication during normal sideband operation but on occasion you do, there's NOTHING wrong with transceiver. Unfortunately changing the SG switch was a waste of time and money.

The SG switch does one thing. It controls the "polarity of the final tube's screen voltage". In the "OFF" position, the final tube screen voltage is "Positive", and is the "normal" position of the SG switch. Placing the SG switch in the "OFF" position places a "Negative" voltage on the final tube screens, causing the final tubes to be "cut off". The "OFF" position is ONLY used when neutralizing the final. It has nothing to do with the ALC voltage except in the "OFF" position the final tube simply are "CUT OFF" and the final tubes do not conduct resulting in zero IP current and zero RF output.

Correction:

The SG switch in the "ON" position provides a "positive" screen
voltage to the final tubes. The SG switch in the "OFF" position
provies a "Negative" screen voltage to the final tubes.

Hi the main thing to remember with any SA is not to put power into
them. Never, ever put more than +10dBm into it.
Any more power than that you must use an external attenuator.
If I remember correctly the RF attenuator on that RF module is
repairable should manage to overload it.

Also a good starting point is the set the ref level on the IF unit to
0 dBm and the RF attenuator to 20 dB.

Apart from that the HP141 is pretty indestructible. but apply common
sense with the intensity on the tube (brightness), that way you
shouldn't get anymore burn marks, than there are now.

Have fun

Thanks Richard,
I am reading the Manuals before I do anything.
I did turn it on to be sure it powered up after unpacking it and read
the basic setup instructions.
I will follow your advice.

From: alw8oc
Topic: 19545 Message: 19550

Thanks for the extensiv explanation of the alc function Mike. Very helpful. I never had anyone explain that function so completely, and understandably. OK, alc readings, are lack of readings on the meter are not a problem. How about my other issue. Very low output rectified by moving the sg switch back and forth. By the way, that's why I replaced the switch (no expense, as I had another one in my junk box). Any idea why that would bring full output back to life and what might be causing that issue?

Thanks again,

Al

Topic: 19545 Message: 19551

Al,

More than likely the SG switch was very dirty and/or corroded.

If moving the SG switch ON and OFF a number of times caused the output to increase then most likely the switch was very dirty/corroded. Dirty and/or corrosion creates a resistance and, at times, can create an "open" circuit, that would affect the final tube's screen voltage. If the resistance in the switch due to dirt and/or corrosion was high enough the final tube voltage would be lowered. This would result in a lower output. The dirty switch was acting like a resistor in series with the final tube's screen supply. I would bet if you had measured the final tube's screen voltage before and after replacing the switch, the voltage would have not been the same, it would have been lower with the old dirty/corroded switch in place.

Have fun and enjoy. Oh, and by the way. If you connect a linear amplifier to your 830, make the ALC connection between the 830 and the amplifier then follow the amplifier's instructions on setting the ALC voltage level fed back to the 830, if the amplifier has one which most do these days. You'll be glad you did.

73
Mike

For those who may have the same problem with the freq readout going out or reading wrong, here i what I found: After cleaning everything in the radio I could get at with Deoxit (which cleared up a different minor problem) and still having the same problem, I found the screw that holds and grounds the small board behind the readout was the problem. I rocked it back and forth a few times and the problem went away. It came back so I pulled it out all the way and cleaned the screw, circuit board and the threads where it mounts and it seems to be working fine now. Hopefully it will stay working.

thanks for all the advice.

Doug

Ok Gordon , put away the manuals
Take a foot length of coax with a BNC plug on each end.
Plug one end into the cal o/p on the IF unit and the other in to the RF I/P
Set the slide switch to 0-110 MHz, tune to 30 MHz and play to your hearts content with the resolution bandwidth , IF bandwidth and sweep times etc.
Sticking your head in a book will not teach you how to use it.
If you down to a hardware shop and buy a hammer you dont need to read the manual to use it.
only the important bits , like don't hit your fingers when driving in a nail.
With a SA its don't put too much power into it.

Experiment with looking at the fundamental and the harmonics, if the signal looks all horrible and bent, play with the sweeptime, and IF bandwidth.

The RF plugin you have can also be used as a general purpose Rx, and before someone says they can't, GCHQ in Cheltenham UK used to use hundreds for just the purpose.

What you should have got is the 8554 RF plugin as you can tweek the yig tuning to cover up to 1300 MHz , covering 23 cms.

Anyone wanting to argue its OT , try using 28-30 MHz as the IF for 23 cms. therefore not OT.

There is nothing you can break by putting its own cal signal into the RF i/p.
If you have a mainframe that is OK be careful not to turn the intensity up too far when in storage mode, it looks horrible if you do, and most 141 mainframes available now either have defunct storage or burnt

tubes, so the damage is probably already down.
If you have a good one your very lucky...

have fun

Thanks Richard,
I am doing just that. I connected the short jumper last night and
started playing. Lots of fun and you are right, this is the best way
to learn.
To use the RF unit as a general RX, do I just connect my Antenna to
the input and take a look?
Thanks for all the help and tips.
Yes, My mainframe is in GREAT shape and does not appear to have any
burn ion marks. I want to keep it that way too!
From what i read, I must be sure to keep the background Green and not
black.. Correct?
73,
Gordon

Hi Mike
Just ran the test today heres the results
10m.- very slight peak from zero not readable
15m.- same as above
20m.- S/1.5 peak
40m - S/2
80m - S/2
160m - S/2

Subject: [TS-520_820_530_830] Re: TS-820 S-Meter

Try turning the calibrator ON and tune the calibrator signal in and
adjust the DRIVE control for peak S meter reading. Don't zero beat the
calibrator, tune the VFO and DRIVE control for peak S meter readings.
What are the S meter readings on each band?

Hello Mark,

Since the receiver appears to be working fine and from the results you
have provided, it appears the S meter is out of calibration.

Do you have the TS-820's service manual? If not, you can download it
free at the following link:

http://bama.edebris.com/manuals/kenwood/ts820s/

The S meter alignment is on page 47 paragraph 2-8 at the top of the page.

If you do not have a signal generator you can use the 820's
Calibrator, although it will not be as accurate, as a signal source
during the adjustments.

Yes Gordon
That applies to the storage mode, keep the persistence low as well.
to use it as a Rx plug an antenna into the RF i/p, tune the required
signal to the center of the screen, then switch to zero span, Keep the
IF bandwidth as wide as possible , reducing it after peaking the
signal, use 2dB/div or Lin, you should get a demodulated signal out of
either the penlift or vertical output sockets.

You can keep the grass down using the baseline clipper.

19559. Re: PC-1 Phone Patch and PSK-31

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-01-04 04:17:02 UTC
From: raydeeoh08
Topic: 19539 Message: 19559

I use a PC-1a (same thing except connector). If you want to use your mic for phone, connect it to the front of the PC-1 and connect the PC-1's mic connector to the rig. Then connect your sound card's audio output to the LINE input on the back of the PC-1. I use the constant voltage audio output from my TS-940 to the LINE input for my sound card, but there is no reason you couldn't use a "Y" connector from your rig's speaker output into the LINE input - just make sure to pad it so it doesn't overload the input to your soundcard.

When you switch the PC-1 to the "OFF" position, the mic will be engaged for normal phone use. When you switch the PC-1 to the "ON" position, your mic will be muted and your PSK-31 output from your sound card will be routed through the LINE input to your rig's mic input.

I intend to do something a bit more sophisticated for PSK-31 in a week or so as I want to continue to have the flexibility of using the PC-1a for a phone patch, but for now it works very well indeed.

Cheers,
Robert

Ok so you are running your radio audio directly to the computer and bypassing the phone patch with audio output (not connecting it to RX IN on the patch and then sp output to the computer.) This way the patch activates the VOX on my rig (TS520S).

I'm thinking of ordering a Signalink USB as I don't think I need to run VOX for that to work

[Non-text portions of this message have been removed]

19561. QRP with TS-820s

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-01-04 10:26:30 UTC
From: robert_glerum
Topic: 19561 Message: 19561

I want to use my TS-820s with a recuced power of 25 W in SSB mode (because af license restrictions).

How can I do that?

I found in a suvival guide for the 830 (mind I use a 820)the following:

[QUOTE]
On SSB, turning down the mike gain is a very poor way to reduce output power because doing so defeats the transmitter's ALC system. Thus, when you turn down the mike gain, you cannot assure any particular peak output level, and you're also turning down only the voice modulation content of your signal; the original carrier suppression, unwanted sideband suppression, miscellaneous transmitted noise, spurious and so forth are not adjusted "down," at all, but remain as they were. As such, signal quality overall suffers. The best way to "turn down" the power of a TS830S - and many other rigs of that vintage that have no power level control on SSB - is via the external ALC port on the rig's rear panel. Providing an adjustable bias level to that port, ranging from 0 V DC to □10 V DC, will allow full-range power adjustment, down to zero output. This is easily accomplished with a 9 V transistor radio battery (be sure to wire the "+" battery terminal to chassis ground - the ALC voltage supplied must be negative) and a 1000 Ohm potentiometer wired as a voltage divider.
Tune up normally with the pot adjusted for zero voltage at the ALC terminal, and you should have about 100 W output. With the key down, now turn the pot until the power falls off to whatever power output you desire. Then, switch to SSB and your output will be that reduced level. DO NOT RETUNE anything on the rig, its tuning will be just fine. This is the way I adjusted to output power of my TS830S for many years, it works perfectly and still provides all the normal audio punch and clarity, but at reduced output power. (WB2WIK/6)
[END QUOTE]

I can't find a external ALC port at the rear of my 820s (nor at the 830).
So how can I manage?

Are there other solutions?

Ok, I spoke to soon. It worked fine for about 8 hrs then started the same thing again. It would read something totally out of the band, then the numbers would flicker on and off, sometimes it just goes crazy and only one number will come on and it jumps all over the place. Any other ideas? The rig is transmitting fine and seems to be staying on freq. according to the analog dial and using the marker.

Robert,

The ALC on the 820 is on the 8 pin octal socket pin 6. Ground is on pin 1. The 820's ALC threshold voltage is approximately -6VDC.

I assume the digital display is the DG-5. So my thoughts are based on the DG-5.

My first thought is the 7805 regulator is failing. Replacements are easy to fine, Mouser has them, and are cheap.

Since the radio, as you have said, is working fine otherwise, I don't suspect a problem with the radio. I assume you have cleaned the cable connections.

I seem to be mistaken about the radio, it appears it's an 820 not a 520.

If the radio is an 820 then I stand corrected. There's no DG-5 but a "DG-1" which also has a 7805 regulator located on a small PC board next to the rear of the IF UNIT on the left rear of the 820 on top of the chassis. The 7805 may be failing.

You can check the regulator by measuring the output voltage, it should
be 5VDC. If it is less than 5VDC then the regulator is failing.

Try blowing canned air on the regulator and if the problem goes away
then the regulator needs to be replaced. A can of circuit freeze works
better.

turn down the mike gain, or car level..... use a external meter should show the results...

Subject: [TS-520_820_530_830] QRP with TS-820s

I want to use my TS-820s with a recuced power of 25 W in SSB mode (because af license restrictions).

How can I do that?

I found in a suvival guide for the 830 (mind I use a 820)the following:

[QUOTE]
On SSB, turning down the mike gain is a very poor way to reduce output power because doing so defeats the transmitter's ALC system. Thus, when you turn down the mike gain, you cannot assure any particular peak output level, and you're also turning down only the voice modulation content of your signal; the original carrier suppression, unwanted sideband suppression, miscellaneous transmitted noise, spurious and so forth are not adjusted "down," at all, but remain as they were. As such, signal quality overall suffers. The best way to "turn down" the power of a TS830S - and many other rigs of that vintage that have no power level control on SSB - is via the external ALC port on the rig's rear panel. Providing an adjustable bias level to that port, ranging from 0 V DC to -10 V DC, will allow full-range power adjustment, down to zero output. This is easily accomplished with a 9 V transistor radio battery (be sure to wire the "+" battery terminal to chassis ground - the ALC voltage supplied must be negative) and a 1000 Ohm potentiometer wired as a voltage divider.
Tune up normally with the pot adjusted for zero voltage at the ALC terminal, and you should have about 100 W output. With the key down, now turn the pot until the power falls off to whatever power output you desire. Then, switch to SSB and your output will be that reduced

level. DO NOT RETUNE anything on the rig, its tuning will be just fine. This is the way I adjusted to output power of my TS830S for many years, it works perfectly and still provides all the normal audio punch and clarity, but at reduced output power. (WB2WIK/6)
[END QUOTE]

I can't find a external ALC port at the rear of my 820s (nor at the 830).
So how can I manage?

Are there other solutions?

Yahoo no longer permits images in their groups. If they are sent via email, they will be seen by email subscribers, but not those who receive the group in digest form or read on line.

There is a trick to getting images in the messages, but the easiest way is to set up a free account with PhotoBucket and up your images there...then you can C&P the URL of the image and insert that in your post. All we, as a reader have to do, is click on the hot link and go view.

Like this:
http://s11.photobucket.com/albums/a177/MCharlie/?action=view¤t=Shack-1.jpg

Hope that helps!

hello mike
went to my TS-820 manual done the IF boards adjustments now everything is great I can even get an S-meter reading on local QRN and some big readings on local QRM HI HI.
Hope to get my callsign through soon (red tape is thick in VK) and maybe I'll hear you on the bands and make a contact can't wait to work some DX.
Cheers 73 from VK

Hello Mark,

Since the receiver appears to be working fine and from the results you
have provided, it appears the S meter is out of calibration.

Do you have the TS-820's service manual? If not, you can download it
free at the following link:

http://bama. edebris.com/ manuals/kenwood/ ts820s/

The S meter alignment is on page 47 paragraph 2-8 at the top of the page.

If you do not have a signal generator you can use the 820's
Calibrator, although it will not be as accurate, as a signal source
during the adjustments.

Hello Mark,

I'm really glad the S meter is now working properly. Over time components age and factory setting don't always give the same readings as they did when the radio was new. However, you seem to have fixed the problem and that's all that counts. Good luck on the call sign issue and hope to hear you on the bands soon.

Joe, Your falcon is a beauty, Don't get me wrong...your wife is
sure enough pretty too...but the falcon....Ahhhhhhhh...WOW!! I am
still DROOLIN!!!!!!!!!
Especially enjoyed the picture of the HWY Patrolman at your window!!
Very nicely done, I would die for a ride in her. I have a feeling it
will set your head right back in the seat.
Look me up when you're on the east coast, would be a privlige to have
an eyeball qso.
Thanks for the link to your personal photos..That is one ROCKIN
little ford.

From: jwsanders2002
Topic: 19578 Message: 19578

I am a relatively new ham with a functional Yaesu 857D [do all] mini station and very happy with it. BUT today I purchased a MINT [no marks anywhere] TS-820/VFO-820/AT-200/MC-50 listed on my local Craig's list. This makes an elegant but classic station with SO SO much for me to learn. My first question is where can I find a REASONABLY priced 8 pin Remote VFO Interface cable. Searcing the web turns up only an EBay dealer who is asking $44.95 plus shipping. Considering I paid $400 for the whole station I hope someone can help me with a more reasonable source.
Thanks, Jack

Topic: 19577 Message: 19579

Funny this letter would come up just as soon as I have ordered a pair of 6146Bs from RF Parts. I took up electronics for my shop in hs and that was how I came upon ham radio. It was the early 70s then so we had nothing but heathkit SB line and they had tubes in them. When I got involved with audio amps, the need for a matched pair of tubes or transistors became more apparent because of the stereo amps.

I have heard that the matched pair was not a necessity with the TS520 finals but with the Ameritron AL-811 series, they are recommending matched pairs, trips or quads.

I've been a ham for a long time and was always embarrased to ask what

the significance of a "matched pair" of 6146's was. I'm now old enough

to not worry about being embarrased, so can anyone tell me why I should

buy a matched pair of tubes vs just ordering two tubes. Thanks

Matched pairs are necessary in a push-pull configuration where each tube supplies the amplification for 1/2 of the sine wave. Since the tubes in Kenwood transmitters are parallel and not push-pull, it won't make a bit of difference. Keep your money and get a dozen donuts for your friends.

connectors for the NINE pin are showing available at kenwoodparts.com 2.13 each, the wire can be the rotor cable since only 8 wires are used.....

I guess it depends on your soldering capabilities....

I am a relatively new ham with a functional Yaesu 857D [do all] mini station and very happy with it. BUT today I purchased a MINT [no marks anywhere] TS-820/VFO-820/AT-200/MC-50 listed on my local Craig's list. This makes an elegant but classic station with SO SO much for me to learn. My first question is where can I find a REASONABLY priced 8 pin Remote VFO Interface cable. Searcing the web turns up only an EBay dealer who is asking $44.95 plus shipping. Considering I paid $400 for the whole station I hope someone can help me with a more reasonable source.
Thanks, Jack

Matched tube are used to BOTH tubes are working the same to produce output. In other words, each tube draws the same amount of plate current while transmitting.

The gain and or emission of the tube is measured and recorded. Then tubes with equal gain or emission are shipped to you.

Probably because it sounds nice.
It is a bit like a good looking lady wearing earrings. If they are a matched pair they look good. If they are not matched but are an equal weight then she can still hold her head high.
Hope this makes sense

Hi,

The differences between a matched pair and a non-matched pair when used in
r.f. is very minimal if it can be detected at all. When used in audio, there
are people who say that they can hear the difference between a matched pair
and a non-matched pair of tubes. However, about 99 percent of the people
can't tell the difference!

I agree, spending more money on matched pair of final tubes is a
waste. However, for those who believe in it then more power to em.

Your most economical alternative is to make your own. The plugs are available for a few dollars and 8 conductor cable is also readily available. If you want to go for the least expensive forego the plugs and insert the tinned ends of the cable into the sockets. Its a straight through connection, no cross overs, e.g. pin 1 on radio goes to pin 1 on the remote VFO, etc.

Search the group archives for information on plug vendors.

Good luck.

K7MEI, Brent

For new Eastern European-made EL34s, they are generally so good these days that any two you take out of the box will be as close as you'd get without very accurate matching. Whether or not this extends to 6146A/B valves I don't know.

As a relative n00b in the world of valve PAs, I'd say the crucial difference is that in an audio amp, the output valves are working in push-pull. Any mismatch here will result in one "half" of the waveform being amplified a little less than the other. You'd hear this as second-harmonic distortion, which is what most of that nice "warm valve sound" is!

In the PA used in the TS520, the two valves are run in parallel, with separate anode and grid chokes and separate cathode resistor. This will allow each valve to "do its own thing" with regards to anode current. Since they're not in push-pull, they will be just about as linear as their biasing allows them to be.

Gordon

W7RY de NX3G/

The filter you're looking happens to be on e-bay as I type this.
The bidding is at $24 something right now and there are 3 days till
the end of the auction. The URL is too long to post here, but it is
auction #190277979877 These filters pop up on e-bay pretty regularly.

If you search for 'cw filter' you will usually turn up 20 or more on
any given day. Search for 'kenwood cw filter' and you should hit one
or two weekly.

I work on a lot of old guitar amp. In these circuits that are class a/b amplification in a design that is much like push/pull then matched tubes are desirable. In these circuits there is only one source for bias current and the goal is to have each tube have the same cut on/cut off points. If the tubes are matched and each tube if fed from the same bias current source then each tube should be working to amplify each half of the waveform the equally.

Kurt,

Push-pull amplifiers do not operate the same as parallel amplifier do. Most, if not all, RF final amplifiers with two or more tubes, operate in "parallel" not "push-pull". Therefore, comparing Push-Pull to parallel amplifiers is like comparing Apples to Oranges, they're not the same. Biasing is the same, all tubes receive the same bias voltage, but operation, Push-Pull operate entirely different than parallel does.

The comment I made, "Most, if not all, RF final amplifiers..." was meant to mean transceiver and/or transmitter amplifiers. It is not directed at/to an AM DSB Class AB2, or any Class C amplifier. Class AB2 amplifiers draw grid current during a portion of the cycle but not the entire cycle and Class C amplifiers draw grid current during the entire cycle. Most tube RF amplifiers in all tube or hybrid transmitters/transceivers operate in Class AB1 where no grid current occurs during the entire cycle.

The bidding is at $24 something right now and there are 3 days till
the end of the auction. The URL is too long to post here, but it is
auction #190277979877 These filters pop up on e-bay pretty regularly.

If you search for 'cw filter' you will usually turn up 20 or more on
any given day. Search for 'kenwood cw filter' and you should hit one
or two weekly.

a/b amplification in a design that is much like push/pull then matched
tubes are desirable. In these circuits there is only one source for
bias current and the goal is to have each tube have the same cut on/cut
off points. If the tubes are matched and each tube if fed from the
same bias current source then each tube should be working to amplify
each half of the waveform the equally.
>

I'm trying to understand this discussion. (Just arrived at the
amplicication classes in my full license study book!)

I use a TS-820s. I was thinking that the ssb mode uses AB class and AB
is push and pull and needs the matched pairs.
And the cw mode uses C class and there is no need of matched pairs?

Don't know what a parallel use of the finals means. How do they work
together?
Which class of amplification are these finals in?

Thanks Mike,

But this is the same one I connected my external VFO. Should I
disconnect it or is there a way to use both the external VFO and the
QRP option?

From: Dave Tipton
Topic: 19596 Message: 19596

I acquired a TS-830 and Desk Mic out of an estate. I fired it up, and it worked fine, with an output in the 100 watt range.

It needs some serious love though.

A few days ago, I fired it up and got virtually no output out of it. That said, I'm just going to sell it. I truthfully don't have time to do any work on it right now, and I'd like it to go to someone who'd like a project rig, and wants a bargain.

Receive still seems to be good.

The rig and a Desk Mic (A kenwood MC-something) are both available for $100 plus shipping.

The external VFO does not connect to the TS-820's 8 pin socket on the
rear. It connects to the "9" pin socket.

I assume the external VFO is the Kenwood VFO-820.

By the way, why did you connect the VFO to the 8 pin socket? Did
someone tell you to do this? If so they told you wrong!

I have the same question, Dave. Who ever said to connect the VFO to the 8 pin socket did not know what they were talking about, especially if the external VFO is the VFO-820. This caused the person to do the wrong thing. Hopefully it didn't damage the remote VFO.

19607. T599 finals

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-01-07 22:03:27 UTC
From: Bill Barron
Topic: 19607 Message: 19607

Finally have the R599/T599 twins 'up' ... but no real
output power from T599. A new driver tube installed ...
but only low exciter output.. no meter deflections.
T599 will not tune-up....

Old S2001 tubes installed.
Can 6146Bs be used as replacements?

Obviously this thing needs a lotta work... but receiver seems ok!

Bill W1WAB

19608. Re: 6146B matched pair

From: w5rkl
Topic: 19577 Message: 19608

Robert,

Push-Pull is with 2 tubes, or transistors, A and B. During the first half of the cycle, tube/transistor A conducts producing output while Tube/transistor B does not conduct producing zero output. During the second half of the cycle, tube/transistor B conducts producing output while tube/transistor A does not conduct producing zero output. This creates a "push" and "pull" amplification affect between the amplifier tubes. Normally, not always, the input and output of a push-pull amplifier is transformer coupled from the driver to the push-pull input and from the push-pull output to the load. Notice I said "not always". Push-pull amplifiers operate 180 degrees out of phase from one another.

Parallel is when both tubes/transistors are connected in "parallel" and both tubes/transistors conduct and produce output at the same time regardless of the period of the cycle. The output from a parallel amplifier is combined together and fed to the load. Parallel amplifiers operate "in phase" with one another.

Topic: 19607 Message: 19609

If changing driver and final tubes does not increase output then there obviously are more problems.

I recommend making voltage checks at the power supply, visually inspect the filter capacitors for signs of aging (bulges, burnt equalizing resistors, etc) and visually inspecting the transmitter for signs of aging/cracking/burnt or otherwise failing components to start with. The manual can be downloaded from bama's mirror website.

Check the driver transistor (3SK22) to the 12BY7. Should be the only one
in a socket. If you get low to no drive in the tune up mode, especially
at the lower frequencies, this could be the problem. 6146B's will work
fine in the T599. I've been them in the rig since the 90's.

Great transmitter and sounds good in the AM mode.

The Model # for the 9 pin connector is E05-0901-05 which I check with East Coast (Kenwood Parts) and that particular connector has been discontinued. I am looking for (2) also but have not found any anywhere. So if anyone else can tell me where to get one I would appreciate it also

I have the same question, Dave. Who ever said to connect the VFO to
the 8 pin socket did not know what they were talking about, especially
if the external VFO is the VFO-820. This caused the person to do the
wrong thing. Hopefully it didn't damage the remote VFO.

I'm gonna jump in on the D-104 wiring subject. We are in luck and have the wiring from Pappy which helped a great deal. One additional question with respect to the D-104's. All mine have a plain gray wire cable. They are probably quite old and are as stiff as can be. Does anyone have ideas for a source of this plain type wire that is pretty flexible or a coil type cord that is not really expensive. The coil cords that I found were about $50 or $60. I guess we need 4 or 5 conductors. I also would like to wire up a UG-8 or TUG-8 to my TS-830s. Thanks very much, 73 Peter KC2RBX

Hi Robert,

Yes, your you can use the external qrp circuit
with or without the external VFO.

the VFO uses the 9 pin socket on rear of the radio.

the qrp external circuit (aka 'mod') is attached to the
8 pin amplifier socket on rear of the radio.

For new Eastern European-made EL34s, they are generally so good these days that any two you take out of the box will be as close as you'd get without very accurate matching. Whether or not this extends to 6146A/B valves I don't know.

As a relative n00b in the world of valve PAs, I'd say the crucial difference is that in an audio amp, the output valves are working in push-pull. Any mismatch here will result in one "half" of the waveform being amplified a little less than the other. You'd hear this as second-harmonic distortion, which is what most of that nice "warm valve sound" is!

In the PA used in the TS520, the two valves are run in parallel, with separate anode and grid chokes and separate cathode resistor. This will allow each valve to "do its own thing" with regards to anode current. Since they're not in push-pull, they will be just about as linear as their biasing allows them to be.

W7RY de NX3G/

The filter you're looking happens to be on e-bay as I type this.
The bidding is at $24 something right now and there are 3 days till
the end of the auction. The URL is too long to post here, but it is
auction #190277979877 These filters pop up on e-bay pretty regularly.

If you search for 'cw filter' you will usually turn up 20 or more on
any given day. Search for 'kenwood cw filter' and you should hit one
or two weekly.

From: Kurt Cathcart
Topic: 19577 Message: 19625

In guitar amps the mismatch presented itself as a hum. Fender Guitar amps changed from a bias circuit to a hum balance circuit sometime in the mid 1960's. The reason for this is that it was too expensive for Fender to sort through all the tubes looking for matches. Instead, what they tried to do was to find a happy balance between the tubes to eliminate the hum. It is a very popular mod to change the amps back to the bias adjust circuit as it better utilizes matched tubes.

Then there is another camp of guitar audio buffs who like their tubes mismatched. They say that this creates desirable harmonic distortions that make the sound more "rock and Roll".

You Said:
As a relative n00b in the world of valve PAs, I'd say the crucial
difference is that in an audio amp, the output valves are working in
push-pull. Any mismatch here will result in one "half" of the waveform
being amplified a little less than the other. You'd hear this as
second-harmonic distortion, which is what most of that nice "warm valve
sound" is!

Robert,

The Kenwood hybrid transceivers, all of them, and many other sideband transmitters and transceivers have a final RF amplifier that operates in Class AB1. The MODE switch does NOT change the final amplifier from Class AB1 to Class C. The final RF amplifiers in ALL Kenwood hybrids and many other sideband transmitter and transceivers operate in Class AB1 in ALL modes.

Peter ,

Try this gentleman, I purchased some parts to repair some D-104's from him.
I ordered two coiled mike cords and the price was reasonable.

Subject: [TS-520_820_530_830] Re: Still need help with microphone

I'm gonna jump in on the D-104 wiring subject. We are in luck and
have the wiring from Pappy which helped a great deal. One additional
question with respect to the D-104's. All mine have a plain gray
wire cable. They are probably quite old and are as stiff as can be.
Does anyone have ideas for a source of this plain type wire that is
pretty flexible or a coil type cord that is not really expensive.
The coil cords that I found were about $50 or $60. I guess we need 4
or 5 conductors. I also would like to wire up a UG-8 or TUG-8 to my
TS-830s. Thanks very much, 73 Peter KC2RBX

19629. low pass tvi filter causing high SWR

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-01-09 02:27:26 UTC
From: wvogel67
Topic: 19629 Message: 19629

I was beating my head against the wall trying to figure out why I was getting high swr readings. So I bypassed my low pass filter and swr was fine again.

I didn't think a filter could cause trouble like that.

Bill

All an antenna tuner is is a filter, actually. Filters change the phase of

the signal as you get to the "knee" of the filter, and an antenna tuner
changes the phase of a singlat to return out-of-phase voltage and current
to
proper phase so they don't travel backwards down the line any further (to
the coax for an antenna-mounted or "remote" tuner, or to the xmitr for a
tuner mounted at the rig/xmitr).

A filter is a tuned circuit. If components in the circuit are defective, the circuit is no longer tuned. Thus high SWR.

What kind of filter, what brand, what is the cut-off frequency? On what frequencies does it have high SWR, or better stated,high RETURN LOSS?

Next time your at a ham swapmeet, but one of those cheap CB mikes (usually under $5.00) with the coiled cord that almost always finds its way to a table or too. I have even picked them out of "FREE" boxes. I use such a cable on my D-104 and I cut it short so I don't have a mile of unwanted cord on the desk. Good luck, Rich

Whether they are defective or not, check the SWR on a filter in the "knee"
with a 50 ohm carbon resistor across the output. I promise you you won't
see 1.0:1

W7RY de NX3G/

The filter you're looking happens to be on e-bay as I type this.
The bidding is at $24 something right now and there are 3 days till
the end of the auction. The URL is too long to post here, but it is
auction #190277979877 These filters pop up on e-bay pretty regularly.

If you search for 'cw filter' you will usually turn up 20 or more on
any given day. Search for 'kenwood cw filter' and you should hit one
or two weekly.

Hi Guys. $50.00 is not a bad price. I see the YK-88C filters going for around $75.00 (plus shipping)on ebay lately. This is the 500Hz CW filter. I don't see a YK-88CN (the 270Hz one)very often.

Good luck with your decision Jim.

From: martin
Topic: 19576 Message: 19636

Hi Guys. I just got a TS-130SE (via eBay) that is in very good condition, and has the YK-88SN SSB filter, and the YK-88C CW filter. While I like my TS-530S, I wanted a radi that coud operate on a deep cycle battery for those pesky power outages and Emergency operation.

This is the second Kenwood radio that I have owned with the narrow SSB filter, (the first was a TS-430S)and it is very useful at times. I am not a CW op, but the CW filter seems to be pretty effective too. I would recommend the narrow SSB filter to anyone. If you have never used one, you don't realize how much it can help (along with the IF shift)in crowded band conditions

Sooner or later (when I can afford it) I will be looking for a YK-88SN for the TS-530S as well. Now if we could just get some decent weather so I can get my 80M dipole moved to a better and higher location, and get my Hustler 5BTV and 2M J-Pole up...

Dear OM,

My mistake, my mistake!
I thought the remote connection was the same as the VFO connection,
which wasn't!

Is a plug of the remote control still available or should I connect
the wires to the socket directly?

19642. Filter mode relationship

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-01-10 01:46:33 UTC
From: ko4kl
Topic: 19642 Message: 19642

I am looking for a CW filter for my TS-520S. While waiting to find one I looked at the installation procedure and the schematic. It looks to me that when the option wire is moved from the SSB filter to the CW filter that filter will be used when mode switch is in the CW, USB or LSB position. Shouldn't the wiring be such that the SSB filter is selected in the USB and LSB modes and the CW filter in the CW mode? This of course would require a lead from the mode switch to each filter. I can't believe the wiring and option as it is in the schematic so I must be missing something - old age does that believe me!

19643. Tun on mode switch not working

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-01-11 12:02:11 UTC
From: markcurry65
Topic: 19643 Message: 19643

The TUN function on my TS-820 dose not seem to work at all.
I have followed the manual and no success.Can anyone
help with this problem.Radio itself works fine and I can still
operate all bands without it but it would be nice to have it working.
Thanks
Mark

I have a surplus TS520S User Manual (not original - a very good copy though) that I'd like to give away (includes mailing) free. If you need one let me know.

From: martin
Topic: 19642 Message: 19646

Hi. With only the SSB filter, the radio uses the SSB filter on both SSB and CW. When you install the CW filter and move the wire to the CW terminal, the radio will use the SSB filter for SSB, and the CW filter for CW.

Mark,

If the rig can be tuned up in CW mode but there is no response in Tune mode then check R6 and R5 on the HV board, X43-1110-00. Both are 56K. R6 is probably open or very high in resistance.

Dear OM,

My mistake, my mistake!
I thought the remote connection was the same as the VFO connection,
which wasn't!

Is a plug of the remote control still available or should I connect
the wires to the socket directly?

Check R5 and R6 on the HV board. they go open and you will lose the Tune function.
they are both 56k resistors.

Hello All,

Just picked up an MC-50 microphone for my TS-530S. According to the manual the microphone impedance range for the TS-530S is 500ohms to 50Kohms. The MC-50 can be set for either 600ohms or 50Kohms. Any advice on which MC-50 setting would be better to use? I will be playing with it on the air today, so should get some input there, but thought this group might have some good insight.

Thanks and 73,

Steve K7QHU

19659. TS 520 drive voltages?

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-01-11 22:18:09 UTC
From: kg4kri
Topic: 19659 Message: 19659

Hello, all
I am restoring a ts 520se, and I have run into some trouble with the driver stage.On my scope, I am only getting about 1.5 volts to the 6146 grids from the driver. All tube voltages check out. What is the range of proper drive that I should expect to see at the 6146 grids? Also, what kind of drive should I see going to the 12by7? I have replaced all tubes with no change in output.
On a different note, I have noticed that the hv plate supply is running high at about 950 volts. This cause arcing in one set of replacement tubes I tried. Is there a way to lower the b+? The filter caps are a little aged, but they are still within specs.
Any help with these questions is appreciated.

Daniel,KG4KRI

19661. Re: TS 520 drive voltages?

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-01-12 00:39:37 UTC
From: w5rkl
Topic: 19659 Message: 19661

RF to the driver should be about 2 volts and to the final about 46 volts. These ratings are taken from the 520 service manual's "Transmitter Section Level Diagram". Although there is a difference between the 520 and the 520SE, I doubt the drive voltage will be much different, if at all.

I suspect the 520SE's transmitter needs aligned. The owners manual describes the alignment procedures in details and it doesn't require special tools to perform the alignment. Just follow the instructions in the manual.

The average HV on the plates of the 6146/SA2001 final tubes is around 900VDC. The best method of measuring the HV is to use a DVM and not the 520SE's panel meter.

If a replacement tube is arcing it's not because of the plate voltage,
it's because the tube is bad.

Thank you all for your input! I am glad to know that the plate voltage is not abnormally high- you just can't trust new tubes to be good. I have performed an all-around alignment, so I suspect the problem is in the driver/predriver/transmit circuits. Thanks again.

Someone mentioned the socketed MOSFET on the driver board a few days ago as a possible source of trouble. Tomorrow when I get a chance I'll measure the voltage on the grids of my TS-520 if you like. I can't imagine it'll be too different from a TS-520SE.

> On a different note, I have noticed that the hv plate supply is

With no anode current, the front panel meter reads just a touch over 900V on my radio, with brand new valves in it. At idle (60mA anode current) the meter reads around 850V or a little less, and with 200mA anode current it drops to 800V. I'm not sure that 950V is a problem. Is it possible that the set of valves that arcs is maybe a bit soft? I'm using some NOS 6146A valves which appear to be nice and tight, and with good emission.

Gordon

19665. Screwdriver antenna infromation

OK, strange thing started happening last night. When I put the transceiver in transmit mode, either voice or CW/TUNE, it takes about half a second before the meter/wattmeter/amp shows that there is any RF output. Nothing, then 1/2 second later, full output. I can hear the relay click immediately when I switch.

I am thinking I will access the relay and clean it to see if that helps but I was wondering if anyone had any other ideas?

Bob

How would one become an adopted kid of his so that one could inherit the estate? I really can't imagine all those radios in one place. I've been looking back through 50+ years of complete subscriptions to QST/CQ and Ham Radio magazines given to me by a friend and I see those radios on the pages and here this fellow has all that history that I see printed. I'd really like to just walk through and touch some of those rigs. Even set them on the bench and play with them for a bit.

It pains me to think of the hundreds of thousands of them that ended up in landfills (imagine the archaeologists digging up some of this equipment in a 1000 years and finding vacuum tubes). That is just tragic...perhaps some of that TARP money could be used to bail out us amateurs that love vintage gear like this?

It could happen. Say it with me "It could happen!"

No, it's not like Grouply. If you're getting a lot of emails about your profile status, it's probably because someone you know is using Microsoft Windows and therefore has a trojan that has read their address book and is spamming everyone it can find - including you!

I know just how you feel. When I was young man in 1955, a dentist in our town was clearing out the house his mother had lived and died in. He was in the process of moving a floor standing Philco radio to the dump. He didn't know if it played or not but it was leaving. I got the radio, free, and took it home. My Mom was really pissed, but Dad stood by me. It took me about a month to figure out what it needed to play, AM only, This was before FM and SW was not part of the bandwidth. It was beautiful almost a Victorian case with nice woods and my new grill cloth. Sounded like a dream.

And here is the rest of the story. That radio played daily for the next three years until I left to attend the Military Academy at West Point. Four years later I learned that my old radio had taken that fateful ride to the dump. I went to the dump to find it. Someone agreed with me. It was gone.

I agree. This is not the first forum in Yahoo Groups that has 'come
to my site' messages posted. It is a form of SPAM - a commercial
enterprise trolling for 'marks' to come to its site. In the
off-chance that it ACTUALLY is a forum member asking, then the poor
guy should be trolling the 'personals' somewhere else.

I did not join this KENWOOD boat anchor forum to hear people whine
about not having visitors to their damn facebook page! This forum
contact person should complain to Yahoo to see if crap like this can
be blocked from the forum.

I need some detail. :) When instructions say to tune in to this signal on a given frequency, what mode? zero beat? I'm a little confused. I saw a set of instructions for an alignment in the files section and wanted to give it a try to see if the rig is off or not and don't want to hose it up. I've had my 830 for about a year now and am just getting into it. What a nice radio. It sounds so much better than my 746Pro and can hear much better! thanks in advance. 73 AI4NV Steve

Try Ham Radio Deluxe. Simon is reworking the logbook so it might become a little more independent on the next release. I use it as my main logbook now even if I am running the 450 or the 520.

N1MM has a "buck" button. Which is for the old Buckmaster. But if your on line, N1MM goes to qrz.com and gets the info.

From: w5rkl
Topic: 19688 Message: 19693

Steve,

The calibrator will produce a calibration tone at 25Khz intervals. When it says to "zero beat" that means to tune the dial until the tone disappears, you do not hear a beat note. It doesn't matter what sideband you use.

To determine if the calibrator is on frequency simply tune in WWV at 10Mhz in any sideband and zero beat WWV. Turn on the calibrator and if the calibrator frequency is correct you should not hear a beat note. Without touching the dial or the function switch, switch between USB and LSB or vice verse and you should not hear any change in the zero beat. The best WWV signal is when there is not tone or talking sent from WWV, only "ticking".

19694. Shure 444 to TS-530S microphone connection... possible?

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-01-14 18:34:21 UTC
From: Jeff Easterly
Topic: 19694 Message: 19694

Acquired a well-used Shure 444 desk microphone recently, to use w/ my TS-530... Upon opening the base, I found only one set of switchable contacts... The Kenwood operations manual states that two sets are required, to key the xmitt section, & break the audio lead on rcv... Will using the one set of contacts to switch the keying circuit be adequate for low-power operation? :-/

Thank you, & 73...

19695. TS 830S Band switch

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-01-14 18:37:43 UTC
From: kb7oge
Topic: 19695 Message: 19695

I was given a Kenwood TS 830S and it is driving me nuts (more so than usual). When I try to tune the finals I turn the band switch to the band and it is like nothing has happened. Some times if I flip the send/Receive switch the band switch kicks in I tried spraying contact cleaner on the band switch contacts and no improvement.
During the tune up (when the band switch works) when I flip the send /receive switch the meter goes to) and my external power meter shows no RF. It doesn't matter if I am using the drive, plate, or load the meter goes to 0. I have the 830s connected to an antenna that is presenting a 1:1 match to the antenna.

Any help would be appreciated.
Thanks

Thanks Mark and Doug,

Not sure how important they are, but I had the same problem with the pdf file as with the powerpoint. The notes referenced to page 5 are missing.

19706. Re: Screwdriver Antenna powerpoint to pdf

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-01-17 16:38:57 UTC
From: kc2pcr
Topic: 19701 Message: 19706

The only presentation notes I found were on page 8 & are included (pg8)in the pdf, If there are other notes available, I can add to the pdf.
Page 5 references the note1, note2, etc in the illustrations..But I really dont know if there is also text as well the powerpoint had no other embedded notes.

Greetings Group, could someone suggest a supplier for a 'standard'
round 4 pin microphone connector that will fit a TS-520S / TS-830S?

Thanks in Advance, John

19710. No transmit when on SSB TS-829

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-01-15 20:02:37 UTC
From: jwsanders2002
Topic: 19710 Message: 19710

I am a newbie in dealing with the Vintage gear and am taking this one step at a time. After a few days of practice I feel confident I have the radio tuned-up properly. I am using the AT-200 to monitor the power settings. OK I have everytging in place: I tuned into the dummy load setting on the tuner connected to a dummy load. My setings are exactly right - 60ma idling, and tweeking the drive, load, and car, show exactly 100 watts on 75 maters according to the AT-200. Now when I try to transmit on SSB using the M50 microphone absolutely nothing happens even if I yell. However if I switch the mode to CW and key the mic the AT-200 shows 100 Watts out and reflected 5 watts back. What if anything am I doing wrong or check for. I am not goods with hands-on stuff inside the transciever and fear a trip to the Radio doctor may be in order.

Whew! Thanks, Jack N7BBX

19711. Re: [TS-520_820_530_830] No transmit when on SSB TS-829

JACK,
Make sure the Mic gain is turned up first of all. Next, work the
processor button in and out a few times. I have seena dirty processor
switch cause what you are describing.
If that doesn't help, I would be checking the Mic wiring.
73,
Gordon

Much to my surprise, they are actually available at Radio Shack in the
drawers they have for loose parts.

CB accessory shops, or eBay? I don't know where you are, but in the UK
Maplin stock them.

Gordon

Hey guys,

I have had a TS-820S for a long time and recently dusted it off and fired it up. I noticed that the VFO knob does not match what the digital display says. I guess its not a huge deal but I would like it to be right. Before I open the radio and mess with it myself I thought I would ask and see if there is a standard way to align the knob.

See the following link for a picture of my problem.

http://www.freemansgarage.com/images/ts820s.JPG

Thanks,
Mike

Hi. I have to say that if you can't find the proper mic plug, you are just not looking. Radio Shack carries them. Don't have an RS store? Anyplace that sells electronic parts or CB radios should have them. If you cannot find one locally, you can order them from hundreds of places on the internet. I am sure Mouser Electronics has them, and no minimum order. They can also be found on eBay.

Get out the phone book and call around. Look on the internet. One place or the other you will find them if you look. ;^))

-
Most CB microphones use these. the cord wiring is not the same but the plug is the same.

Truck Stops, CB shops, and as mentioned before Radio Shack usually have them.

Check trash cans at truck stop fuel islands for discarded CB mikes.

These are probably the most easily obtained mike plugs of all the designs.

If you know a truck driver or a active CB operator, see if they have an olde mike laying around that is bad or of no use. If it is a CB operator, give them a pitch about ham radio while you are at it.

Subject: [TS-520_820_530_830] KENWOOD MICROPHONE CONNECTOR

Greetings Group, could someone suggest a supplier for a 'standard' round 4 pin microphone connector that will fit a TS-520S / TS-830S?

Thanks in Advance, John

Unless you have a giant dent in your 520s cabinet top, look in phone book for "powder coat painting" and get both top and bottom done. They will find a color very close to origional and you will be happy and better off price wise I believe with new pained cabinet. I have a Hallifcrafters HT37 job done and it looks better than new. Good luck, Rich K8UV

Hi Ron. At least you have a mic that you can use until you get a plug.
I have been lucky enough to get a MC-50 mic with my TS-530S, and
recently bought a TS-130SE that came with a Kenwood MC-30S hand mic. I
also was able to make a trade for a MC-42S that I have rewired
(originally an 8 pin mic) to use with my radios as a spare.

I have seen Kenwood mic fairly often on eBay lately, but they seem to go
for rather high prices. As I have found out in years past though,
pretty much any hand mic and a lot of desk mics will sound good on these
older Kenwood radios.

19725. Adjusting the AF unit 9v and 3.3v TS-820

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-01-19 03:29:29 UTC
From: mikefr24
Topic: 19725 Message: 19725

I did a lot of reading on this forum and I found instructions on how to adjust the 9v and 3.3v on the AF Unit using VR1 and VR4. I adjusted VR1 until the voltage was 3.3v (it was 2.5v). I am having trouble getting the 9v. I am measuring only 5.8v and no matter how much I adjust VR4, it will not change. Maybe I am not measuring in the right spot? I am measuring voltage between the chassis and pin1 on the AF1 plug.

This all came about because my S meter is not very sensitive (it only twitches with a S9 signal) and also the radio has a bit of drift.

Thanks,

Mike

Mike,
Do you show 14 volts on pin3 of the AF1 connector to ground?

Hello Mike,

Unfortunately, there is no way to adjust the 14 volts. The 14 volt supply is the basis for the 3.3VDC, 5VDC, and 9VDC. The 14 volt supply also powers other circuits and the relay. Naturally if the 14 volt supply is low due to component failure on the RELAY UNIT, then the 3.3VDC, 5VDC, and 9VDC sources will also be affected.

I recommend cleaning the plugs and pins on the RELAY UNIT first. If that does not improve the voltage then I suspect one or both of the 2200ufd 25VDC radial lead capacitors on the RELAY UNIT may be failing, dragging down the 14 volt supply. The two capacitors in question are located on the RELAY UNIT board on the bottom of the 820. The RELAY UNIT is the only board with a plug in relay and two radial lead filter capacitors mounted on the board. The key here is to ensure the 3.3VDC and 9VDC on the AF AVR units is good plus the 5VDC on the RELAY UNIT's RL-1 plug pin 14 is good. The 5VDC on RL-1 plug pin 14 and 9VDC from the AF AVR unit powers the PLL ASSEMBLY UNIT's logic circuits. The 9VDC also powers the VFO and if both voltages are low the 820 will drift quite a bit.

Mike,
No, But you might want to check and see what your line voltage is.
Sounds like it might be low.
Next I would check to be sure the diodes D8, D9,D10 and D11 on the
Rectifier unit.
How accurate is your test meter?

19733. Precautions to prevent "fixers" of hybrid rigs (worthy discussion) NN4P

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-01-19 15:57:02 UTC
From: Brian G. Jett
Topic: 19733 Message: 19733

Good day! And a Happy New Year!

My name is Brian Jett and I wanted to get group input as well as some preventative measures for those of us who toy around with fixing Kenwood hybrid rigs. Any tube radio or other for that matter and the danger and pontential for hurting oneself by not using proper common sense steps. In short, I am scheduled to see an orthopedist due my carelessness in working on a TS-530SP. Top off and tubes exposed and heater on, I became hurried or simply wasn't thinking (obviously) and touched the cap on one of the 6146B new tubes I replaced. My Lord, what a jolt and the rig and mic literally were forced back (law of resistence or force) against the wall. I am surprised my wife didn't wake up as the shack is below our bedroom. While I am "painfully" aware of my stupidy, this I suspect happens more than we hear of and my ego mended well before my right arm which still hurts and strains now when holding a coffee cup for a period of time. The burn marks or where the voltage busted open the skin on my thumb and index finger (right hand) is still slightly visible after the blunder some eight weeks ago. Not sure what damage to my arm was incurred, but it flat hurts and isn't getting any better with time - conversely - worse.

Some are reading and laughing as it is totally silly and the visual likely of my shout "heard around the nation" with the rig, mic and this rube convulsing for a few seconds upon the "shock" of it all would open up comic review of more than overviewing precautions.

So, if one knows by personal experience what can happen to the human body from such currrent and some "common sense" help and steps to prevent "common sense" to be more overtly common b/f the next "fixer" blows out his or her joints or worse, it would be a worthy discussion.

Yours truly and truly plumb goofy,

73s thankfully not QRT permanently....
Brian "No Clue" Jett

NN4P
Vanity Call didn't help me at all when that volt bid for my full attention. (Smile) Can know at least.

Hi Mike,

This problem was reported some time ago - 2 or 3 months I guess.

The solution given by Dave is OK for the kHz dial in the lower window - it's the way you have to calibrate the kHz dial reading per the user's manual, but not for the 100 kHz dial in the upper window, and your picture show clearly the problem.

Search the files with ' dial ' and you probably will find it.

As I remember, the procedure is covered by the TS-820 service manual you can download for free at several places on the web.

It's a little bit tricky but not that difficult.

Good luck & 73's - Daniel, ON5PY

Here are some E-Mails, I got for a similar problem, which worked for me, once I figured it all out.

Re: [TS-520_820_530_830] Re: TS-820 DG-1 Display tube

Thank you SO much for the help! It took me a while to figure out that the mounting plate for the inner dial was on a collar with a set screw which could be adjusted so that the 5 on the inner dial could be placed at the One o'clock position. Once I noticed the set screw, it was just a matter of trial and error to get the final minor adjustments "just right" so everything lines up correctly, and is synched with the digital display.

Incidentally, the digital diplay "went out" again this morning, but I was able to just remove the display tubes (and their PC board mounts), clean the mounting screw holes and I then placed a star washer on the screws. I reassembled all of that and the digital display is working like it should, and now the vernier display is also working correctly!
Thanks again!

Subject: [TS-520_820_530_830] Re: TS-820 DG-1 Display tube

Before removing the escutcheon, make a mental note of the thin red vertical calibration line on the escutcheon's small clear dial window.

The inner dial contains the 1, 2, 3, 4, and 5, numbers that appear in the outer dials small window. For example if you tune the VFO to 7.000, the outer dial "zero zero" marker should be in line with the thin red calibration line on the escutcheon and nothing should be showing in the "zero zero" window. Tuning the VFO to 7.100, the outer dial's small window should now show "1".

The starting point for the inner dial is to place the inner dial on the VFO shaft with the number "5" at the "one o'clock" position and tighten the dial's set screw. Then place the outer dial on the VFO tuning shaft with the "zero zero" dial marker in line with the thin red calibration line. The outer dials small window should be blank, nothing showing in the window.

You more than likely will have to make adjustments to both dials to ensure this happens.

I applogize for the using the numeric "1" instead of writting out the word which caused confusion. In addition, I also stated "00" on the inner dial which I actually meant the outer dial. I failed to remove it in my response and I appologize for that.

>
> If I'm reading this right, the "key" to getting the vernial dial diplay to agree/work right with the digital is to orient the inner dial so that the 5 on the wheel is at the 10 o'clock position. What position should the other number/frequency dials be set to? 00, 100, 200, 300 or what? When I got my 820S the inner dial did not agree with the frequency readout, so I removed the inner dial. Later the digital frquency dispaly went out, (no digits/wrong digits etc.) but I was able to cure that problem by removing the digital display, and cleaning the 4 screws/holes which held it in place, then reinstalling it. The digital works fine now, but I would like to get the vernier dial working properly again.

19737. Couple of problems

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-01-19 19:47:19 UTC
From: rickoreair
Topic: 19737 Message: 19737

I recently started rehabing my old TS530 trying to fix one problem at a time. The receive audio was almost non existent, and I found a bad AF pot. I replaced the pot, and the audio is much better, but still not as good as it should be. With the RF and the AF pots fully open, the audio is just below what I would consider normal listening level. Any ideas what to check next?

2nd problem is there is no transmitter output. I have replaced the RF board, and the 6146 PC board. The RF board had a couple of burned components, and one of the top caps on one of the 6146's was burned. (lightning??) High voltage reads good when the meter switch is in the HV position, but ALC and IP don't read anything, as I try to tune as per the manual. Any other checks before I replace the 6146's??

Thanks for any help.

Rick WB4BSP

19738. KENWOOD MC MICROPHONE CONNECTOR

Yahoo group: TS-520_820_530_830 (2009)

Thanks very much to everyone for the prompt replies, I should have mentioned I'm in Canada.

We have no CB, trucker or independent electronic stores anywhere close by so it looks like I'll have to wait for the Orlando HamCation next month as we have no Radio Shack stores left here either. They were replaced (sort of) by the Source but they don't carry them & can't or won't? order them. Mail order from the US is $16+ parts - way over the budget!!

I know it's a long way to travel but we have to do our part to support the Florida economy, LOL ;-)

19741. Re: Adjusting the AF unit 9v and 3.3v TS-820

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-01-19 22:03:45 UTC
From: mikefr24
Topic: 19725 Message: 19741

Thanks for the response. I found the Relay unit and cleaned the plugs
with deoxit. No luck with that. Next I tested the voltage on the
pins. Pin 14 seems to be a ground however pin 13 reads 4.76v.
Here is what I measured on all the pins on RL-1

14) 0v Ground?
13) 4.76v
12)12.8v
11)12.8v
10)12.7v
9)12.7v
8)12.8v
7)12.8v
6)30v
5)13.58v
4)2.25v
3)5.8v

I do not have any 2200uf caps laying around. I will have to order some.

Mike

19742. Re: Adjusting the AF unit 9v and 3.3v TS-820

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-01-19 22:45:27 UTC
From: w5rkl
Topic: 19725 Message: 19742

I'm sorry, I mistyped RL-1 pin 14 as the 5VDC. Pin 14 is ground. Pin 13 is the 5VDC.

The following are the RELAY UNIT's RL-1 plug identification labels and normal voltages.

If the AF AVR UNIT's AF1 pins 1 and 2 indicate less than 9VDC then the RELAY UNIT's RL-1 pins 1, 2, and 3 will show the same as AF AVR UNIT's AF1 pins 1 and 2.

RL-1 pin 4 is the AGC/ALC (AGL) line switched by relay connection RL-14 on the RELAY UNIT between receive and transmit. Voltage varies depending on incoming signal strength in receive and ALC voltage produced in transmit.

RL-1 pin 5 is from the RECTIFIER UNIT's "14" pin. It should be approximately 14VDC.

RL-1 pin 6 is ground. This pin is also connected to RL-1 pin 14. There should be zero voltage on this pin. I see you indicate "30V" on this pin in your 820. Are you sure?

RL-1 pins 7 thru 12 are 14VDC. This is the source 14VDC to the AF AVR Unit AF1 pin 3 as well as a few other boards. A lower voltage here will cause the 9VDC to be less as well as the 14VDC to the other boards.

RL-1 pin 13 is 5VDC. This voltage powers the PLL ASSEMBLY UNIT 5 volt logic circuits.

RL-1 pin 14 is ground, also connected to RL-1 pin 6.

RL-1 plug pin 5 is the source 14VAC from the power transformer's 14VAC secondary windings.

19747. Re: Adjusting the AF unit 9v and 3.3v TS-820

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-01-20 04:03:32 UTC
From: mikefr24
Topic: 19725 Message: 19747

I got it working! I took the AF unit and the RELAY unit out. I cleaned the ground area where the screws tighten really good and when I put them back in I was able to read all the correct voltages. They were off a bit so I adjusted them to 9v and 3.3v. Also the 30V on pin 6 was a misread on my part. It was 30uV. I did not notice the Volt scale changed on me. The S meter is alive again too.

My radio is kicking once again and I thank everyone who helped me out.

This is my only HF Radio so its gotta stay alive. I should just go buy a new one but since this one keeps on working I always talk myself out of it.

Good Fix Mike,
and Thank you for sharing the root cure.

73,
Gordon

Great Mike!! When I work on Kenwoods etc I first treat all jacks, connectors I can reach but most importantly work all board
screws a few times to start at ground zero. Fine group suggestions from all.

Enjoy

Bill KB9IV

Subject: [TS-520_820_530_830] Re: Adjusting the AF unit 9v and 3.3v TS-820

I got it working! I took the AF unit and the RELAY unit out. I
cleaned the ground area where the screws tighten really good and when
I put them back in I was able to read all the correct voltages. They
were off a bit so I adjusted them to 9v and 3.3v. Also the 30V on pin
6 was a misread on my part. It was 30uV. I did not notice the Volt
scale changed on me. The S meter is alive again too.

My radio is kicking once again and I thank everyone who helped me out.

This is my only HF Radio so its gotta stay alive. I should just go
buy a new one but since this one keeps on working I always talk myself
out of it.

By the way, my experience level is that of a neophyte. I'm an
electrician, and can follow instructions, but am NOT an experienced
electronics tech, so thanks in advance for your help.

Congratulations Mike!! Thank you for sharing your fix with all of us.
The 820 is a great transceiver as are all of the Kenwood hybrids.
Again, congratulations Mike. Have fun and enjoy.

73
Mike

19752. Re: Adjusting the AF unit 9v and 3.3v TS-820

Yahoo group: TS-520_820_530_830 (2009)

I got lucky cleaning some dirty contacts. You guys told me where to start looking. I appreciate all the excellent advice on my problem.

I do like the 820. It's huge and heavy and the tubes are fun even though they are way before my time.

How many 12v lamps are there supposed to be in the S meter? I only see one in mine.

Mike,

The meter has "2" lamps and the VFO has one, each bulb's voltage rating is 12 volts.

Radio Shack use to sell small 12 volt "Wheat" lamps in pairs. I'm not sure if they still do, you could check the parts drawers.

I replaced the lamps in my 820 with Radio Shack 12 volt Wheat lamps about 2 years ago. The meter lamps failed about a month ago and I used the last two bulbs I had, gotta get some spares.

73
Mike
W5RKL

19754. Re: [TS-520_820_530_830] How to allign the VFO knob.

Yahoo group: TS-520_820_530_830 (2009)

From: Daniel TOESCA
Topic: 19717 Message: 19754

Hi,

Most intermittent problems - even display ones, with only some segments lighted - are due to corrosion in the multipin connectors between units.

Removed them one by one, soak an old toothbrush with contact cleaner, do the pin side and the female side, applying some cleaner into these, and go to the next one.

The grounding fork on the VFO capacito shaft is also a common issue, there is a small removable cover on the right-hand side of the VFO looking at it from the front panel. Open this one removing four screws and spray the fork with contact cleaner, then turn the VC through its whole course several times, and try the set again. It should be OK.

In more severe cases use a very fine grade thin emery paper between the fork and the shoulder of the VFO axis.

That's all.

Some of the other available options are somewhat better quality castings
for
the shell than the ones from Radio Shack, but if you are in a jam, as soon
as my local Rat Shack restocks (I bought both the ones they had to make
cables for both my Kenwood and my new Ten-Tec) I will arrange to get you
some at my actual cost for purchase plus shipping, which should be well
below online prices plus all that shipping charge.

Try a hobby shop. I picked up some 18V bulbs for my 530s many years ago and they seem to last for ever and provide sufficient light.

Subject: [TS-520_820_530_830] Re: Adjusting the AF unit 9v and 3.3v TS-820

Mike,

The meter has "2" lamps and the VFO has one, each bulb's voltage
rating is 12 volts.

Radio Shack use to sell small 12 volt "Wheat" lamps in pairs. I'm not
sure if they still do, you could check the parts drawers.

I replaced the lamps in my 820 with Radio Shack 12 volt Wheat lamps
about 2 years ago. The meter lamps failed about a month ago and I used
the last two bulbs I had, gotta get some spares.

Mine was okay after I stuck new valves in, and replaced the crumbling
cathode resistors. The VFO scale is a little off, but I can live with
that - more than I can live with dismantling the front panel, anyway.

Everyone compliments the lovely audio from it, so I suppose it must not
have a hum on transmit.

Gordon

Hi Rich. Well, you seldom see the guys who get a good one post here...and considering the age of these radios, its not surprising that some have problems. I traded a computer for mine...total cost to me was $45.00 for my TS-530S, and MC-50 Mic. Mine had been used, but not abused. Its got some normal wear marks and a scratch or two. It needed a driver tube, and the switches cleaned. I also have replaced one of the plastic gears on the Drive control shaft, and the band-switch coupler in the final compartment. Even well maintained radios this old may need a little TLC. I also did the alignment as instructed in the manual. It has now worked like a champ for over a year with no issues at all, and I expect it to work for many more years without major problems.

I am sure that there are a lot of guys who got one of these radios with no problems. But the giuys who need a little help with something are the ones who post the most...the squeaky wheel you know...

Glad you got a good one!

TTYL

Rich, you are not the only one out there. Over the course of 23 years as a ham I have had several Trio and Kenwood rigs. I must say that not one has ever had an issue, except the one R-599D I bought. These are the Kenwoods I own and use now on a daily basis:

TS-520, TS-820, JR-310/TX-310, TS-120, R-599D/T-599D

I have owned several TS-520/820 series rigs and none of them ever had an issue. I am a casual user 95% CW/5% Phone and don't contest. As you said, they reliably work as they should, have full+ power output and sensitive/selective as the devil.

When I purchased the R-599D, it had medium sensitivity and an almost non-reading S-Meter. 6 Transistors and 2 Diodes later on the IF board, rectified both problems.

I have been a member of this reflector for many years and do catalog some of the excellent repair suggestions, just in case one day something does fail.

One last thing; the beauty of these rigs, for me is that, due to their lack of maintenance; I can spend more time homebrewing at my bench.

73, Lou N2JPR

Hiya Gordon,

I agree. These are great old radios. I've owned my TS-520SE since new. I got this radio for a Christmas gift for passing my license back in 1979. the tubes are original and I still get full power plus alittle. I run the rig with the same mic, too (D-104 "Silver Eagle").
After all these years, the radio is still in line, although, I mostly use it on 40 & 80 meters for my usual rag chew sessions..HI
I run a FT-2000D for DX-ing. The radios flank either side of my station desk.
The TS-520SE will always hold a full time spot and dedicated antenna in my shack for years to come!

19766. TS-520 Efficiency Vs. Tube Life

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-01-22 02:02:31 UTC
From: Richard Glassner
Topic: 19766 Message: 19766

I have just purchased a TS-520 from an estate sale and performed the transmitter tuning according to the Kenwood manual. All seems ok with several great QSOs made over the last few days. I have several questions that that are probably answered by a single response.

For "Novice Operation" the manual reads:

"...adjust the carrier level control to keep the plate input power below 75 watts (approximately 90 ma). Adjusting the carrier level yields much less power output because it reduces the efficiency of the tubes."

I operate CW only at 50 watts, 5 watts, or less than 1 watt with the various rigs that I have used. The TS-520 is currently set for 50 watts out as read on the external wattmeter.

Does reduced efficiency decrease the life of the tube? In other words, is operating at low power a problem for the tubes or should it actually increase the life of the tubes? Please explain any mechanisms of tube degradation, low power vs. higher power.

Thanks for the response,
Rich-- NØEAX
Jefferson City, Mo.

TS-820S.

On 20m and 15m (I haven't checked 10m - why bother at this point in the solar cycle), I hear some kind of signal every 61 kHz. It kinda sounds like a buzzsaw in a sea shell.

I know I haven't given a whole lot of useful information, but I was wondering if anyone else experienced this with a Kenwood. Is it likely something with the receiver, or should I go looking for outside sources (computers, network equipment, wireless router, ???)? Is there something magic about 61 kHz that escapes me?

Its probably not the radio. Do you hear the noise with the antenna disconnected? I would start looking for switching wal-wart power supplies. Some of them can be very noisy RF-wise. Serial computer modr\ems can also make quite a bit of moise as can routers and their switching power supplies. Lots of home electronics are never completely off...if the were, you could not turn on with a remote.

Good Luck!

Hello,

I would point towards something other than the radio.... Have any touch lamps in the house?? Plasma TV? Any timers on the living room light? If you have any flouresent lights in the house, turn them all off and try it (possibly a bad ballast).
Any of these things can create havoc! My wife had this little darn touch lamp in her office and it drove me crazy!

Hope this helps!

Oooh. Always wanted to get a TX-310 to go with my dad's old JR-310.
That was lying around for a long time in storage after he went silent
key, and when I tested it turned out not to be working. I gave it to a
guy who repaired radios for the MoD, who returned it working even less,
and it sat in the loft for another few years. A couple of months ago I
pulled it out of storage again, determined that the VFO wasn't getting
the job done (measured at the trimmer cap, there was plenty of O, which
was about the right F and even V'ed when you turned the dial, but
nothing on the output). Despite the stern warnings to only use the
correct special Trio RF transistors in the VFO, I put a BC548 in to
replace the very dead output tranny, and after a quick realignment it
works brilliantly.

My dad used his with a Panda PR-120V transmitter, which I would love to
be able to track down again. I *think* I know who has it...

You can do the ALC trick with a PP3 battery and a pot - apply a small negative bias to the ALC and you can finely control the power output down to milliwatts!

> Does reduced efficiency decrease the life of the tube? In other
> words, is operating at low power a problem for the tubes or should it

Running at low power should actually extend the life of the valves, possibly by quite a bit. From what I've read - the 6146 line of valves is nearly twice as old as me, so I can't claim any great authority next to some of the old-timers in here - they were built as transmitter PA valves, but are apparently similar to television line output valves (sweep tubes). Now, in a TV, the valves were run quite gently so they would have a long lifespan. Looking at an old copy of the RSGB handbook I see a design for a grounded-grid linear using a pair of PL36s, to give an output of around 60W. The book figure for continuous operation (like, oh, in a TV line output stage for instance) is around 10W, but in the relatively light duty cycle of an amateur radio transmitter you can push them a bit harder. The article says that you can get 100W from your two PL36s if you up the heater voltage and anode voltage, "at the expense of drastically shortened valve life" - no kidding! They would be cherry red!

What mostly happens as valves age is that the coating on the cathode deteriorates, and can no longer fire off as many electrons. Other things happen, like gas slowly leaking in and turning the valve into an inefficient discharge lamp (I changed a pair of EL34s in my guitar amp that glowed blue when you applied HT - pretty, but they sounded rubbish). As the cathode coating loses emission, the amount of current that the valve can pass falls - effectively its series resistance increases - until eventually it basically just has no gain at all.

What affects this process? Well, the temperature that the cathode runs at and the current through the valve are the main two. Not letting the cathode heat up fully doesn't help either - according to the 6146A data sheets it takes around 5-6 minutes to warm up fully, so give it time before you start pounding that key. Finish up your coffee first. The VFO will have warmed up and stopped drifting by then anyway, and you

wouldn't want a drifty signal, would you?

Gordon

Hello Richard,

The answer to your question,

"...is operating at low power a problem for the tubes..."

the answer is "No".

First, ALWAYS tune your transmitter, whether it is a Kenwood hybrid or another make/model, into a DUMMY LOAD.

Tune up the 520 for full output power as described in the manual. During the tuning process, forget about the Novice Operation, simply follow the standard tuning up procedure as outlined in the 520's manual.

Once the 520 is properly tuned for maximum output, reduce the RF output by adjusting the CAR control to the output level you desire.

It is also important to understand that the CAR control has absolutely no control over the 520's output in sideband mode! RF output in sideband mode is controlled entirely by the MIC gain control and any ALC voltage produced in the final amplifier. Therefore, in sideband, adjusting the CAR control is useless, does nothing, and will not affect the 520's RF output! The CAR control ONLY functions and controls RF output in TUNE and CW modes!

Over driving, pushing the 520 for those last few extra watts output, "will" reduce the life span of not only the final tubes but the driver tube as well! Do not get caught up in the "AKTTR" (All Knobs To The Right) syndrome. If you do not always see ALC on the meter, do not become alarmed. There's nothing wrong with your 520. ALC is ONLY produced when grid current flows in the final tube. Grid current flows in the final tubes ONLY when the grids are driven POSITIVE by the RF driving signal. ALC is not always a bad thing. Normal peak ALC meter readings should be kept as much as possible to mid scale on the ALC meter scale by adjusting the MIC gain. The lower the ALC meter reading the "cleaner" your output signal will be. Grid current flowing in the 520's final amplifier produces distortion in the final amplifier's output signal.

I forgot to mention one additional thing that should never be done.

Never detune (tuned out of resonance) the driver and/or final amplifier stage(s) to reduce the final amplifier's output! This will have a negative affect on the life span of the tubes as well as the circuits themselves!

Hi Al,

Your interference could be an ECM (Electronically Commutated Motor) somewhere in your vicinity. There's one in my A/C system which generates inteference every 18kHz, and sounds like a buzz saw. I've been writing the manufacturer for several months trying to get them to do something about it.

Since you're from Michigan, you might be interested in the Michigan Upper Peninsula Net. It's on 3921kHz every evening at 1700 ET, and also on Sunday at 1200 ET. Although it's officially a traffic net, most of the check-ins are just passing the time of day. You don't have to be from the U.P. to check in. In fact, most of the net members are from downstate. Some as far away as Detroit, Ann Arbor, etc. We even have check-ins from Wisconsin, Minnesota, Illinois and Ohio to mention a few. Listen in and if you like what you hear, please check in. Band conditions can affect local nets like this quite a bit, so if you don't hear us one night, by all means, try again another evening.

If you'd prefer to QSO outside a net, just reply to this message and let me know when you might be on the air on 75m. I'm a fairly new ham myself, so I know how exciting those first HF contacts can be. The only contact more exciting to me was my first CW contact. I was so nervous, I could hardly press the key. Great fun though.

Enjoy and as always - 73,

de Randy - K8HRO

hi,

I got my used 520 estate radio along with the vfo, speaker and a Henry DFD/K nixie tube display (real retro) as a package from an ebay seller who was helping her friend get some cash. The radio was very clean, almost new looking inside and outside. I used Deoxit before I powered the radio up and it has original tubes. Works great.

Need a backup radio right? Found a 530 from a high volume ebay seller, says 20m not working, snapped it up since it was in SC and I am in NC $ 12 ups next day !

All it needed was a good cleaning on the bandswitch and 20 back, also did the WARC cut wire and wow, great radio.

I've learned more with these two radios along with following this forum then I ever would have with a modern radio.

I often wonder how many contacts the previous owners made and to what parts of the world.

I agree with this. I established my modulation level experimentally by getting feedback from other hams during ragchew QSOs. Once set, you don't really need to change it. For my microphone, voice volume and mouth position, I found that I should set the control at 3 o'clock. I leave it there and never run any compression.

When I run RTTY (I use AFSK direct from the soundcard in my PC), I may need to fiddle with the control, but I simply return it to 3 o'clock when I go back to SSB. I never change it otherwise and never look at the ALC reading on the meter.

Hi Angie. Great to hear that! You may run into a few groups on 80M
that are not friendly to new hams. Just turn the VFO knob and forget
them if you find any! There are a lot of good folks out there. If you
can hear the Iowa net on 3970 Khz (5:30 PM CST) don't hesitate to check
in. You may even hear me there.

IF you would like, we can try to schedule a contact. Let me know.

You might try listening to 14.300 in the daytime. This is the Maritime
Mobile Service net. Anyone can check in, and get a signal and/or audio
report.

You might also check out www.eqsl.cc eqsl is a way to senf electronic
QSL cards. It is much more economical than sending real cards through
the post office. eqsl cards are not good for ARRL awards though.

Glad to know that you are on the air, and hope to talk to you sometime.

I've had my TS820 for about 5 yrs. Went to adjust the AVR Brd 9V and 3.3V.....the VR4 trimmer (500 ohm) has a broken leg and I'm not sure about VR1 50K ohm.

Radio Shack does not carry these vertical small trimpots. Would any one have any replacements new or used pots?

Thanks

Bill KB9IV

Don't turn the radio power down. That will increase ALC, which is a bad thing for digital modes and introduces distortion.

Leave the radio capable of full power, then turn down the signal coming from the computer. If you need a more fine grained control, put a pot across the signal coming from the computer and run one side and the wiper to the transmitter input.

You should have NO ALC when it's set up right.

I decided to try RTTY for the first time on the morning of the ARRL RTTY Roundup. I already had the software (MTTY) and cables going to the phone patch interface of my rig (TS-820S) and had done some receiving, but had never tried transmitting, never mind a digital QSO.

At any rate, this <http://www.aa5au.com/rtty.html> page helped enormously, especially the section entitled Transmitting AFSK with MTTY. Adjust the ALC until you get the meter to move, and then back it off until the ALC reads zero.

I made about 150 QSO's during the contest, only operating about 3.5 hours. It was a fun way to learn.

By the way, the admonition to not run full power is probably
referring to using the internal FSK keyer, where I think you can use
the carrier level to set the output power.

I don't know that anyone really operates that way anymore. With AFSK
and the right software, it's a lot easier to tune and work several
contacts simultaneously without having to worry about the transceiver
frequency. Most decent software will dynamically adapt (within
reasonable limits) to the mark and shift.

Bill,

I found a few possible VR4 substitutes from Mouser Electronics. These are vertical adjust multi turn trim pots, each 500 ohms. The base pin orientation appears to be the same as the original pot, triangle.

www.mouser.com

Mouser part number is

81-PV37Y501C01B00

Price is $1.30

or

652-3299Y-1-501LF

Price is $2.65

url to Mouse's list of "trim pots" is

http://mouser.com/search/Refine.aspx?N=254352

Click on the trim pot multi turn link then select from the list the pot you are looking for.

I have used this type of vertical trim pot in Heathkit HW-100 and SB-100 series transceivers as replacements for the 200 ohm Carrier Null pots and they are very precise and work very well.

VR1 is a "2" legged pot. A "3" legged pot could be used as a replacement but the center (wiper) pin would have to be soldered to one of the outer legs or the center wiper and one outer leg be used leaving the other outer leg free.

Hi Rich,

Sorry to say it, but I had quite a few band oscillator issues with the R-599
and TS-515 (european TS-511) and TS-520 sets.

Even with a JR-500 with impossible Xtal frequencies.

In contrast, never an issue with the Y...u FT-101 and FR-101 Xtals.

Why ???

Despite that, I still love those Trio / Kenwood oldies !

"Don't turn the radio power down. That will increase ALC, which is a
bad thing for digital modes and introduces distortion."

I disagree with this. Reducing power output will not increase ALC. On
the contrary a reduction of RF driving power will reduce the level of ALC.

ALC is a "control voltage" that is used to control the gain of an
earlier stage. The ALC control voltage, "by itself", does not create
nor does it contribute to the level of amplifier distortion. The ALC
voltage does NOT increase when RF drive is "reduced".

ALC in a transmitter/transciever or fed back to a
transmitter/transceiver from a linear amplifier, operates the same as
AGC does in a receiver, controls the gain of an earlier stage.

ALC is NOT always a bad thing and is not limited to digital modes. If
a transmitter/transceiver ALC meter reading consistently is at or
exceeds the ALC meter scale then the operator is over driving the
input of the final amplifier and a reduction in the MIC gain in
sideband is required. ALC in TUNE mode is nothing more than a "tuning
aide", nothing more, and does not constitute a bad thing when peaking
the ALC during tune up.

61 kHz is a common frequency for switching power supplies. Do you have any equipment on switching supplies???

As a rule, I keep linear supplies on my gear. Even the switching supplies in the fluorescent displays on my DVD player wreak havoc. When I do low signal work, I unplug anything with a fluorescent display in it.

Well I have birdies all over the place and its from my DSL modem which is on the other side of the house.

First step is to unplug everything that is on the same circuit as the rig.

Next go to the breaker panel and start shutting down the power to sections of the house one breaker at a time. Check the rig for birdies every time you shut a breaker off. If it is in the house that will narrow it down fairly quick for you.

Hi Aaron, My old DSL modem used to do that too.
I cured it by purchasing SHIELDED CAT 6 cables for the Modem and all
of my Home networking.
No More interference from that stuff.

19793. TS530s sudden problem

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-01-23 21:41:10 UTC
From: megenr
Topic: 19793 Message: 19793

I have had my TS530s for 20 years, never had problem till last week. The rig has gone from 100 watts output and excellent audio, to how it is now, about 20 watts output on SSB, 50 watts on CW, and have gotten bad audio reports now, along with a bad raspy CW signal . This all happened overnight.

I changed the 12by7a driver, no change. I changed both 6146Bs with a pair of unknown condition from a hamfest. Also no change. I put the original tubes back in, no change.

Idle current 60ma. CW IP now 125ma, used to be 230ma. Same for SSB.

Nothing in final section looks burnt, but this was my first look inside, so I don't trust my own observations.

Since I dont trust the hamfest finals and driver, I thought I would put this out to you all before I take a gamble on buying all new tubes, at over $100. If that didnt fix the problem of my beloved rig, I am sure my wife would remind me of it the rest of my life. HELP

I'm mostly active on PSK31 on 40m, around 7037kHz. Feel free to give me a shout. Today, 20m was quite open to the US and Canada, so it might be worth giving that a go too!

When you can't hear anything at all, you've pulled the breaker to the shack. It's an effective way of getting rid of QRM, but somewhat limiting in terms of actual operation.

Your HV Caps have gone Bad.
Replace them and your HV will be back up over 800 volts and the Radio
will come back to Life.
K4EAA sells HV Cap kits very reasonable.

If it went suddenly, I'd check the HT rectifier diodes, too...

@Ron: if your HT PSU is healthy I'd expect to see about 900V or more with no anode current, dropping to around 800-850V with it running at full chat - at least, that seems to be where mine sits and that seems to agree with the manual ;-)

Just watch yourself in that power supply though - you may recall the mail to the list last week from a lucky person who *did* get a second chance when they got it wrong. I think as a group we've used that karma up now! Be safe, nearly 1kV at nearly quarter of an amp is easily enough to silence your key.

Gordon

19804. No power out

I've tried tuning my 530, and get no output. The HV reads almost 900 volts, but there is no plate current when trying to tune. I've tried tuning in the ssb position as well as the tune position, but no Ip. I do not get an alc reading in the ssb position, but I do get ALC readings in the tune position. What should I check next?? Thanks
Rick WB4BSP

You'd only get ALC readings if you were actually sending in some
modulation.

Have you followed the procedure in the manual for setting the idle
current? You should at least see 60mA or so with no modulation.

Note that I have a TS-520 not a TS-530, but I can't see that part being
very different.

Gordon

Don't know if this matters much for you, but I just remembered that I finally ended up using a 40db (or something big like that) attenuation Radio Shack Special patch cord to connect the speaker out of my soundcard (which is built into a laptop) to the audio in of the phone patch. I found that the audio level was just too high to perform any kind of delicate adjustments otherwise. I run the computer with the output volume on full and the microphone level control around 12 o'clock with that much attenuation to get the right modulation.

If you're running a desktop PC with a line out level from the soundcard you probably won't need the attenuation, or at least not that much.

Topic: 19816 Message: 19816

Hello all,
I have a Trio TS-520D, and I was wondering what the differences between this rig and the TS-520S might be. I searched the message archive, and found that this was discussed in a thread back in 2006. That thread concluded that the 520D was the Japanese version of the 520S. There was a mention of the 520D having only a 75 watt final, but no follow-up conversation regarding the actual output power.

Very recently I purchased an AT-200 tuner. This represents the first watt-meter of reasonable quality that I have been able to attach to this rig. I don't seem to be able to tune the rig up beyond 70 watts.

So my question is this... Is the 520D limited by its final to 75 watts max, or is the lower power due to the rig's age or (very possibly) operator's error? Is there someway for me to inspect the final and determine the configuration?

Thanks for reading...

I believe the Trio TS-520Dis thought to be a Japanese home market
rig.
Check and see if there is only one final tube in the rig.

Topic: 19816 Message: 19820

Well embarrassingly enough, the limitation was due to operator error. I can get 90 watts from the rig when properly tuned on 80 meters, but only about 70 watts on 10 meters. I last used this rig twenty years ago (I was 15), and thought I remembered the tuning process well enough to extract full power. oh well...

On a side note, this radio was purchased in Japan by the original owner, but there are no Japanese markings on the rig of any kind. Aside from the Trio branding, and the 'D' designator it looks just like a 520S. Are there any known differences?

Thanks,
Jason AE5KR

When I bought the rig, the manual I received was a photocopy of the Kenwood TS-520S manual. I don't know if the original manual was lost, or if it was not written in english, but I have not found a manual specifically for hte TS-520D. When the rig was purchased, it had not occured to me to ask about a manual. I was 14 and didn't think books were all that important :)

Live and learn.

Dear group,
I've just bought a nice TS-520. I need to check (and, if the case, modify) the correct wiring of the MC-10 microphone.
I think I have a clear idea about the pin meanings however I am almost clueless about the wires color code. I did a search on the web and I tried to find previous posts about this topic in this helpful group. Both searches were inconclusive. Can you help me?
Many thanks indeed

Check the two cathode resistors. One of mine had crumbled and fallen
apart! The other wasn't far behind, and broke up as soon as I touched
it.

My TS-830S has no output when switched to the Tune Position . I know when it is in this position the screen voltage is reduced.Is there a common problem with a resistor changeing values in this circuit?I have the service manual down loaded but it's hard to look at the path.Thanks for any help in solving this problem.

Just a note to all regarding voltage, current and your heart...If my memory serves me correctly it only requires 90 volts at 5 millamperes to induce MAJOR heart malfunction. Please consider this guys and gals, before you perform troubleshooting with the covers off, and use the advised saftey procedures and equipment as advised!!!

Yes, There are two 56k resistors that open up on the Rectifier Unit.
They are R15 and R16.

Hello group can anyone shed some light on the slight rx peak audio distortion i am experiencing on my Trio TS 830?
The sound of distortion is apparent with the internal and external sp230 when connected.
This seems to have gradually happened,and is more noticable on strong signals S8 upwards.
The bandswich is okay and the distortion in present on all bands and modes.

Any ideas will be gratefully received.

Kind regards Kev M3SND

Kev,

Check the Noise Blanker. It may be turned on and set for a high level.
Strong signals can distort the receive audio under these conditions.

Kev,
Check and clean ALL the connectors on the IF board, the AF board and
the PLL board for starters.
Also, Loosen and then re-tighten ALL the screws mounting each board.
Let us know the results.

As far as I know, the name Kenwood was used by a company supplying
white goods in Europe in the 1970's onwards, it was in the late 80's
that the Trio name was dropped in favour of Kenwood, There was no
difference apart from the name.

A35KR de NX3G/

HI Jason.

You should get familiar with K4EAA's web pages. There you will find a myriad of information about our hybrids to include some history. On this page, http://www.k4eaa.com/faq.htm you will find this paragraph:

One of my friends has a 520D. What the heck is THAT?

I think I have one of those also - Buried in my stash of Kenwood radios . . . The 520D was a non-export, Japanese market radio. Obviously, a number have made it to the U.S. over the years. The only caution here is to make sure it's wired for 120VAC operation, because the factory defaulted to 100VAC for use in Japan.

So there you have it Jason. You DO have it modified to accept 120v, right?

- Larry - NX3G

Hi, I want to put lamps in my VFO-520 and my AT-200 to light them up. I see in my Kenwood TS-820 repair manual that it calls for a "Kenwood Pilot Lamp" part nos# (B31-0241-05).

I haven't had my radio apart, but see in the manual that they are using two of these lamps on either side of the meter, and imagine that the proper way for me to do this would be to use two lamps on my other two meters as well.

1: Here is what I would like to know. What is the generic reference to these lamps, so that I don't have to get special parts (and so I can have them before anything comes apart)?

2: Has anyone done this, and is there anything I should look out for (can't imagine anything, but I'll ask just in case)?

3: And finally, I'm planning on connecting these auxilary lamps to the same lines as the lamps powering the meter in the radio, does anyone forsee a problem with this?

Thanks in advance!

Jeff KB3QMT

Some users have replaced the 1N60 diodes on the IF board (D20, D21, D22, D23) with Schottky diodes such as HP HSCH 1001 or 1N6263. This requires removal of the IF board. While there, you can also replace the corresponding TX diodes with the identical Schottkys to improve TX audio (D29, D30, D31, D32). There is a web site (google search) that details the procedure.

Subject: [TS-520_820_530_830] Rx Audio Distortion

Hello group can anyone shed some light on the slight rx peak audio distortion i am experiencing on my Trio TS 830?
The sound of distortion is apparent with the internal and external sp230 when connected.
This seems to have gradually happened,and is more noticable on strong signals S8 upwards.
The bandswich is okay and the distortion in present on all bands and modes.

Any ideas will be gratefully received.

Kind regards Kev M3SND

If you use the newer "flashlight" type leds instead of lamps you will
get a longer life span. That is what I use whenever a lamp fails.

19848. 6146B, 6146W, and the hybrids questions

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-01-26 21:52:03 UTC
From: Jeramy Ross
Topic: 19848 Message: 19848

Ok. I realize this has all been hashed out in the past in both the Kenwood hybrid circles and the wider glowbug world; however, after searching the web for info. over the past couple of months, I still have un-answered questions.

First question: 6146W tubes of post '65 vintage are generally supposed to be 6146B tubes that passed the vibration, shock, and fatigue spec. as required (vibration, shock, and fatigue spec. as specified in the 6146W data sheet from RCA). Given that, I find conflicting reports of the 'W' not being compatible, different brands better than the other etc. An example is RFparts web site listing one 6146W as great for all, and at the same time saying that the RCA 6146W that the offer is not recomended. Is it simply that the RCAs are of the vintage where they are actually 6146/6146As? Or is there some other reason. I see the RCA 'W' tubes everywhere for pretty reasonable prices, and it would be great to be able to use them in the hybrids.

Next question, Chinese 6146B? Seems there are more varied opinions on Chinese tubes than there are tubes coming out of China, but no clear direction on if these are of decent quallity, work well in hybrids, etc. Any experience with the various brands out there? Again, availible for reasonable prices and are in current production so it would be great to be able to use these in the hybrids, but I am leary due to the stories of not being able to keep them neutralized, their inability to handle the plate voltages that the hybrids throw at them and so on.

Thanks in advance for your words of wisdom,
Jeramy / W5XTL

Hi Jeff,

The VFO520 should have a pair of lamps installed already, they're probably blown. I've replaced the lamps in my TS520 and VFO520 with 12V 100mA lamps that have 6 inch wire leads on them. The Kenwood replacement lamps have 12 inch leads from memory. If you can only find the lamps with short leads you have to splice them in where convenient. I also added a 3 ohm 5 watt resistor in series with the lamps. This reduces the brightness just a little but I hope will increase their life significantly. I prefer the glow of a lamp to that of the LED's but you could also use LED's as suggested by others.

I don't think the extra load of the lamps in the AT200 (If you do install them) will have any effect on the radio.

There is a fellow on eBay with a store that sells the replacement lamps with the leads already attached. He is the one selling the cables for the amp/ALC control for various hybrid rigs. Just do a search under the "HAM" category. I told a friend about it, and he bought one of the cables and is very happy with it. I've never bought anything, so can't personally verify any of his products.

Jeramy,

From what I understand the 6146W tubes of that era are the same as the 6146 and 6146A while the 6146B has about 25% more dissipation. The S2001A, I think, is the same as the Japanese/Matsusita 6146B.

I recently removed my S2001A's and put in a matched pair of 6146W's from RFParts and they neutralized just fine. I think it's worth mentioning that, any tube you choose, shouldn't be supplied with more than 800v.

Rick

With the mike gain up a bit, you should see some movement on the RF meter when you talk into the mike. With it all the way up, it should show some ALC. I found that with my Kenwood TH-F7E actually tuned to the TX output and sitting right on top of my TS520 with no output valves (which is how I got it) I could barely pick up anything from it. It's surprisingly well-screened! If it's not showing at least a watt or two of output, you won't hear it.

It's possible that the mike is broken or wired wrongly. With the set transmitting into a dummy load, buzz the mike input pin on the front panel connector with your finger and see if the meter moves.

Gordon

Having problem with RF output decreasing on 10 and 12 meters. Higher the frequency, the lower it drops. On 10 meters its bout 10 watts. Have isolated the problem to Q81 and associated components on the Signal Unit. Appears like some of the components are on the bottom side of the PCB as I don't see them on the top side. Does anyone have a Signal Unit board laying around that can take a good picture of the bottom side in the area of Q81? Q81 is located in rear near the notch out on the corner. Would like to know what it looks like before pulling mine apart. Looks like electrolic capacitor C295 was touched on side with soldering iron in the past and Q81 has been replaced with a different transistor that has bout the same specs. Wondering bout R264 and C294 values as their also not on top of the board. They are in the feedback loop on Q81 collector to base. Thanks....

The 6146W is the military "ruggedized" version of the 6146A/B. Early versions matched the 6146A spec, and later versions (post 1965) were manufactured to the newer 6146B specs. As it relates to these rigs, the two types are NOT interchangeable. Use 6146B or post-65 6146Ws only. I've never used the Chinese tubes, so I can't comment on them, but I've never seen a price advantage that would make me want to use them over 6146W's

I've re-tubed 7 hybrid rigs so-far (I restore them for newly licensed hams needing their first HF rig). I've always used 6146W's with a post-65 mfr date.

I use JAN (which stands for Joint Army/Navy BTW) 6146W tubes made by GE. There are a couple vendors on eBay that sell them. They come in a plain white box with the mfr date on the box.

FWIW-I have three hybrid rigs of my own (520S, 820S, and 830S). Two of them still have full-output from their original S2001 Matsushita tubes. The other I bought used about 10 yrs ago, re-tubed it with 6146W's and they're still going strong. I don't understand why so many of these rigs I've seen suffer from low output...I can only assume that the previous operator was not properly tuning his rig. I have replaced the driver 12BY7A several times on each of these rigs however.

73,
Brian AC7NA

Yep, that's true of all finals with 6146s. There have been some instances, as Glen Zook's documents state, where 6146B have worked in final designed around 6146 or 6146A but those are rare.

Just because the final produces good output on 80, 40, and 20 meters is not an indication the 6146B is working "properly" in the final stage.

All too often hams simply pull the old aging 6146s out and plug new 6146Bs without checking the final amplifier's neutralization. This is poor operating practice and can lead to problems that could have been easily prevented by taking the time to check the final amplifier's neutralization and, if necessary, adjust the final's neutralization.

Just because a final designed around the 6146 or 6146A produces high output power is not an indication the 6146Bs are operating properly. A properly neutralized final, if everything else is working properly, will produce full output at the same point that maximum plate current "dip" occurs. If de-tuning the PLATE control either side or resonance causes the final amplifier's output to increase 30 watts or more the final needs to be neutralized. Failure to neutralize the finals can lead to not only the problem Glen mentions in his document but higher tube envelope heat due to increased plate current when tuned for maximum output instead of maximum plate current "dip". This results in shortened tube life and added stress on the power supply components as well.

Hi: I'm a new general and have a curious problem. The TS 830 tunes up perfectly, and shows full power on CW. When placed on SSB upper or lower, there is no output. I've listened to the monitor, nothing. I've checked it with two meters beside the one on the radio, zilch. What should I do?

Turn the microphone "on" if using the sm50 or 60. :) kind of like the sg switch. Or the mike gain is not turned up. Or the mike you have is not properly wired.

I just remembered a known Issue.
Sometimes the Processor switch gets dirty and since all Audio goes
through that switch, it will NOT allow any Audio to pass.
Try switching the Processor switch in and out a few times and then see
what happens.

You know if it's a MC50 try unplugging the 5 pin plugs coming out of the mic and the base and flip them over. I would check the one on the base first, they are not keyed plugs so you can easy plug them in upside down. I am assuming that this mic hasn't been confirmed that it worked before this post?

Hi Guys. There is a dot on the base jack and a dot on plug. On the base, they should be aligned. The plug on the mic is reversible to select high or low impudence. Make sure the micas are wired correctly.

OH dear, the novice spouts again.

If you have a high impedance microphone and the terminating load
impedance is low, you will have a reduced output level, it will also
have some effect on the frequency responce.
You can use a low impedance microphone into a high impedance terminated
load. There will again be some effect omn the frequency response due to
the mismatch.

Ah, you're one of the 2m CBers that keys up over MM3 callsigns?

Yes. I should maybe point out that 25 years of designing radio and
audio equipment has given me a little bit of insight into the importance
of impedance.

Now, read the message I quoted again:

> > > select high or low impudence.

Did you read that?

Read it again, carefully - I can see your reading comprehension skills
clearly aren't the best - did you get it yet? No? Oh well.

In future, I suggest you have a long, careful read of posts before you
start talking.

Gordon

Depends what kind of test equipment you have available. If you've got a 'scope or a signal tracer, see if you can find your audio at pin 13 IF4 on the IF board. Does it reappear at TP2 on the IF board? If it doesn't, then something is amiss in the audio amp. You can grab the circuit diagrams off the 'net, if you don't already have them.

If the audio signal isn't present at TP2, check if it's present at the mike gain pot. The service manual has got a "level diagram", where the stages are represented with a symbolic rather than schematic diagram with all the voltages and signal levels marked on it. This may give you an idea of where to start looking closely.

It's worth noting that there are various muting and AGC signals present on the mode switch (well, otherwise how would it switch mode?). On my TS-520, crackly rough CW turned out to be a manky contact on one of the wafers. Even touching the knob brought it up, briefly. Hosing both the band switch and mode switch with contact cleaner and then applying a small amount of contact lubricant has solved that problem.

Gordon

Check the "AGC" switch setting. If it is turned "OFF" then any strong signal will sound distorted.

Unless one is sure one or more of the diodes have failed, I do not recommend changing the diodes.

While there, you can also replace the corresponding TX diodes with the identical Schottkys to improve TX audio (D29, D30, D31, D32). There is a web site (google search) that details the procedure.

I'd actually rather drop it, but every time I post then G8JVM (hang on, isn't G8 a B-class licence? I can't remember now) makes some disparaging remark.

What a great way to encourage people into the hobby.

Richard, please feel free to discuss it privately in a civilised manner with me, or if you like I can pop over and we can chat about it over a pint.

Hi Gordon. Just my bad typing!;^)). If Mr brown is referring to me as
a novice, I invite him to look up my callsign. I am an Extra who has
not bothered to change my callsign and have been licensed since 1990.

While I am not as knowledgeable as some of the folks here, all it takes
is to read the MC-50 manual, which is available on the net in PDF format.

TTYL Gordon.

I think he's referring to me, actually. "MM3" denotes a Foundation licence in Scotland. Since the Foundation licence is pretty trivially easy to pass, some people equate that with youth and inexperience. I really find it quite hard to care about other people's opinions. I know my way around the inside and outside of my TS-520, and it gets used every day. I wonder how many others on the list can say that?

Yes, I *have* only had my licence for about four-and-a-half months, but in that time I have used my TS-520 on 80m, 40m and 20m, with SSB, PSK and RTTY contacts on all three bands, SSTV on 20, Feldhell on 40 and probably one or two others (I haven't got my logbook handy to check). I wonder how many G8s have experimented with as many different modes?

I've pretty much stopped using VHF, because of the "repeater CBers" that start up with all the F---s and C---s when they hear an MM3/MM6 (and in some cases 2M0/2M1) callsign. People who ought to know better! We don't have a lot of that at the moment, mostly because the worst offenders have been slapped by the mighty hand of Ofcom. Still, it's a shame they feel the need to do that.

This is all off-topic for the list, anyway. Below, it's a bit more on-topic ;-)

This bit was a kind of a joke, you see. The original poster typoed it as "impudence", and I found the idea of an "impudence selector" utterly hilarious. Evidently this passed some of the more humourless members of the list by.

now yall have peaked my interest and i have a question about the mc-50.

what is the difference between low and high impedamce?

what effect will this have using either or?

was not aware you can change it on mc-50?

manual i looked at on line did not say much, could some one explain
further?

>
> what is the difference between low and high impedamce?

Usually dynamic mike capsules are low impedance, because they have a small coil of wire attached to the diaphragm. This coil needs to be light, otherwise the microphone wouldn't be very sensitive. So, there aren't many turns on the coil. Now, audio amplifiers typically have a fairly high input impedance, so microphones often have a small matching transformer tucked away inside. Depending on what you plan on using the microphone for, it might be set up for around 600 ohms impedance, or several tens of kilo-ohms. For the TS-520 (and presumably other similar transceivers), it needs to be about 50k impedance.

> what effect will this have using either or?

The most obvious one is that using a low impedance microphone will give you very low audio levels and poor sound quality.

> was not aware you can change it on mc-50?

The plug is reversible. Inside the mike there is a matching transformer with a tap at 600 ohms and a tap at 50k ohms. I haven't got an MC-50 kicking about to look at, but from memory the plug is similar to the 4-pin mike plug but with five pins arranged in a square with the earth pin in the middle. The PTT wires are across one diagonal pair (so it doesn't matter which way round the plug is for them), with high impedance on one pin and low on the other. The actual lead to the radio has the mike connection between one of the corner pins and the centre, so that with the plug one way up the audio comes from the high impedance end of the winding, and with the plug the other way it comes from the low impedance tap. Clever stuff.

> manual i looked at on line did not say much, could some one explain
> further?

Hope this clears it up a bit.

Martin, I was not referring to you.
I did say to take it off list, but alas ignored.
Typos , spelling mistakes, bad grammar are very common on lists where English is not the prime language for all users. I ignore them, its proven that a word can be recognised as long as its nearly phonetically correct, carry on with the typos.
As for licences, I've held mine for 34 years, I never bothered to take the morse test as I have very little interest in HF, I'm QRV all bands from top band thru 10 GHz and building for 24 GHz. I have no restrictions on power so I never bothered to move from the old UK B licence to the old UK A licence. Now of course its irrelevant as there is only one full licence.
I expect the tubes in my TS 530 are likely to last a very long time, I only go on HF when I have nothing else to do.

I haven't pulled the VFO-520 apart and was unaware of lamps in it.
Must be blown. All I was aware of was the two red LEDs for VFO and
RIT.

If there's enough power, perhaps I'd be better off taking the power
from the VFO-520 since I will have it open anyway?

I've run into the same issue with my TS-700. The bulbs behind the VFO dial and the fixed channel knob are burnt out, and the service manual only gives Kenwood's part # which is no help in getting replacements. Since getting to these bulbs involves quite a bit of disassembly, I'd really like to have the new ones on hand before I go to all the trouble of taking the radio apart. Would rather not have to do the job twice.

John,

Every time I have a lamp to replace, I do not use incandescent bulbs.
Especially when they are difficult to get at like you are describing.
Replacing these with high power leds is not very difficult. You just
need the correct current limiting resistor to your dc supply.

The obvious advantage of doing this is never having to do it again.
The leds last a very long time. Of course you need to run them within
their current specs to get this long life.

I have been buying my high power leds from All Electronics.
http://www.allelectronics.com/

I almost always use the white leds but, I have even used some high
power red leds behind meters to make them look nice.

If you need any particular advice about doing this, just ask.

Michael

Michael,
Please post the Info on doing the LED mod.
I think many would be interested in what you are doing.
If you can list Part numbers and values, it would also be a big plus.
Thanks,
Gordon

Topic: 11720 Message: 19891

Hello members,
 Hope everyone is enjoying their Kenwoods. I have a Ts530s and vfo-230. My vfo-230 starting intermittingly blinking and one or two digits coming on and off . A slight tap on top would bring it back and then go blank. Unplugging power it would return and eventually do the same thing. I have tightend all circuit board screws and very carefully cleaned the two relay contacts but now it will not show any display at all. Is it possible the cable between radio and vfo is bad? If anybody has any help for this I would appreciate it. I really have never used the external vfo, but now I am trying to get into Dxing and it is a must to have. I hate not to have it working. Any help guys. Thanks Dave Kc5ee

I have the 820 vfo, and it is wired to the 12.6v AC connection on the 9 pin din. I replaced it with 14 volt 40 ma bulbs, and had no problems

I haven't pulled the VFO-520 apart and was unaware of lamps in it. Must be blown. All I was aware of was the two red LEDs for VFO and RIT.

If there's enough power, perhaps I'd be better off taking the power from the VFO-520 since I will have it open anyway?

I buy all those small Kenwood (other mfr's from the 70's also used them too) type lamps at Parts Express. They have a wide variety of 6, 8, and 12 volts lamps with leads.

Sounds like time to start with a meter or better and O scope and follow the
mike audio till it stops.

Whether it is on High or low impedance or with the plug reversed on the base, audio will pass to the radio and output some power.

I do agree a known good mike is needed first. One could always hook the output of an audio generator to the mike input to test. Sound cards do a good job of this if you do not have test equipment.

Is it a TS820 or a TS-820S you got off Ebay ? You may already know this but the TS-820 did not come standard with the Digital Display but is was available as an add-on option. The TS-820S included the Digital Display. The typical problem with the Display is intermittent operation and cleaning the mounting screws and PC board where the screws mount it sometimes resolves the problem.

Hello folks I purchased this TS-820 recently and have a need for
someone to minimally repair the blank frequency display does anyone
know of anyone near NC or surrounding states that offers this service?

It's been a good many years since I have been on the low bands but
retirement is coming soon and I want to be ready!

Not an operational issue, but rather one of curiosity that I'd like to fix. This group has really helped get a doa TS-530SP radio back going, and is a very valuable resource, and is very much appreciated.

I have two led's that when the switch that they indicate is off, are on very dim. They operate full brightness when their respective switch is on. The LED's are for the RF ATT switch, and the XIT switch. Not a big issue, but I'd like to know why.

I don't know where to begin checking. Thanks in advance for any advice.

The 820's AF AVR board has two plugs closest to the front panel labeled AF1 and AF2. With the front panel facing you and the 820 upside down, AF1 is the plug on the left and plug AF2 is on the right. Pin numbering is from right to left on each plug, 1 thru 6. AF1 pin 1 and 2 are the 9VDC connections and AF2 pin 6 is the 3.3 VDC connection. VR4, located in the middle of the AF AVR board adjust the 9VDC and VR1, located between plugs AF1 and AF2, adjusts the 3.3VDC. Voltage measurements are between plug pins and chassis ground.

Remove the top cover from your 820, being careful not to break the speaker wires. If there is an open space to the left of the VFO your 820 does not contain the optional digital display. The open space to the left of the VFO is reserved for the digital display counter assembly. The digital display tube that is part of the optional digital display is mounted behind the front panel directly above the 100Khz dial and the 5VDC regulator is mounted on vertical supports just to the right rear of the IF board. The IF board is the board mounted along the left side of the 820.

From: Michael
Topic: 19840 Message: 19901

Gordon,

This is the LED I use. LED-75 from All Electronics. It costs 1.20 each. They are very bright.
http://www.allelectronics.com/make-a-store/item/LED-75/ULTRABRIGHT-WHITE-LED-T-1-3/4/-/1.html

If you were going to run this from 12 volts dc you would need to put a 680 ohm resistor in series with it. That would keep you well below the 20 ma maximum for this device. If you have another voltage just use ohms law to adjust the current. The forward voltage drop is about 3.8 volts.

Mounting is up to your own ingenuity. I have always found that part very simple.

This led has a rather narrow beam out of it contrary to the claim by All Electronics. I simply put the lens against my bench grinder and make two 90 degree surfaces where the original lens was. I then polish these surfaces by rubbing on a piece of wood or using my polishing wheel which is faster. This polishing does not need to be perfect.

Mounting this behind a meter distributes the light across the face. The edge of the 90 degree angle should be vertical.

I have also done this using only a 12 volts ac supply using a simple silicon diode rectifier and filter capacitor to get dc.

I do this extra work over just installing another incandescent bulb so I don't need to do it again. Some of these bulbs are difficult to get at.

If someone has found a super bright led that has a very wide viewing angle I would love to hear where I can get some.

BTW I even managed to mount a pair of these in my Kenwood SW-2000 swr power meter. The originals bulbs were grain of wheat bulbs and I had to get creative to get these leds to fit.

Just to return to this for a moment - the original manual that came with my TS-520 says it uses 6146As but the PDF available on KG6HAF's site says it uses S2001As or 6146Bs.

Which is it? I'm using NOS 6146As at the moment and it seems to work. It wasn't particularly easy to neutralise, though.

Topic: 19848 Message: 19904

The Kenwood hybrid manuals for the TS-520 (page 28), TS-520S (page 26), and the TS-520SE (page 23), under the paragraph titled "TRANSMITTER SECTION", clearly states the following:

"The SSB signal is amplified by the 12BY7A driver tube to drive the two S2001A (6146B) amplifier tubes in the final stage. They operate in Class AB1."

Therefore, the correct final tube for all 520/520S/520SE models is the 6146B not the 6146A.

Hi Gordon -- Mike is correct -- early on in the TS-520 series radios they wewre using the 6146A, however - just as you found out they are not very friendly, when it comes to alignment -- This is due in part to that series of tubes design hence the 6146B -- The Japanese equivalent is the S2001B, both are great tubes and will work well in your radio. I can't count the number of times that a Kenwood radio has come into my shop with 6146W tubes and just does work. So, my recommndation is to stick with what works, S2001B or 6146B.

Subject: [TS-520_820_530_830] Re: 6146B, 6146W, and the hybrids questions

The Kenwood hybrid manuals for the TS-520 (page 28), TS-520S (page

26), and the TS-520SE (page 23), under the paragraph titled

"TRANSMITTER SECTION", clearly states the following:

"The SSB signal is amplified by the 12BY7A driver tube to drive the

two S2001A (6146B) amplifier tubes in the final stage. They operate in

Class AB1."

Therefore, the correct final tube for all 520/520S/520SE models is the

6146B not the 6146A.

I see a reason why they wouldn't work. The 8-pin mike connectors supply 8v on one of their pins, which is presumably used here to power the electret mike element. You'd need to make up your own cable, and supply power, either with a small battery or by adding a resistor between the mike signal lead and a suitable supply rail. I would probably go down the latter route, but be aware that this will cause problems for dynamic mikes.

There's not a lot of information on the site (or maybe it's not working well for me, on a slow connection), but I expect if you email the seller they will tell you exactly how to go about it.

I wonder if I have an old manual, or something. It definitely says
6146A.

Oh well, I know what to look out for at the next rally.

I know that various sites mention problems caused by running 6146Bs in
radios designed for 6146As. Is there likely to be problems from running
6146As in a radio designed for 6146Bs? Since I have one of the
much-derided Foundation licences I'm running it at comparatively low
power, but I don't want to toast anything when I turn the wick up. I've
run the transmitter at the full 100W into a dummy load for several
minutes, with no apparent ill-effects - that's not really a real-world
test though.

Thanks to the help I received here I have My Kenwood TS830S up and working. I also was given a VFO-230. I have the manual and have read it but just don't understand why and when I would want to use it. I also need to know how to use it. Could someone please point me to some type of tutorial for the VFO-230. My Icom 737 does not have an external VFO and my old Century 21 did not have one either. I could really use some help.

Thanks

19910. Re: TS-820 twinkle display now off

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-01-29 18:33:24 UTC
From: w5rkl
Topic: 19887 Message: 19910

Forgot to include this part.

The digital display tube, counter assembly, and 5VDC regulator are only present when the digital display option was purchased and installed. The digital display option is the "DG-1" which includes the following items:

5V-AVR (X43-1220-00)
Display (X54-1170-00)
Counter Mix (X54-1150-00)
Counter (X54-1160-00)

The Counter Mix and Counter PC boards connect together inside the counter assembly's metal container through rows of male and female pins. The counter assembly itself connects to the 820 through a multi-wire plug on the bottom of the 820. Power for the counter assembly and the display tube is provided by the 5V-AVR unit. The 5V-AVR unit powers nothing other than the counter assembly. The power source for the 5V-AVR unit is obtained from the 14A supply. Therefore, a failure in the 14A supply results in a failure in the counter unit, no digital display. There are other circuits that will be affected by a failure in the 14A supply such as the receiver's 3.3VDC bias, 9VDC supply for the VFO, PLL, IF, and RF unit boards, and the relay.

Most, not all, digital display failures or intermittent failures occur due to dirty pins on the counter assembly connections to the 820, display tube interconnecting plug, and the 5V-AVR plug, both top and bottom. Cleaning the connecting pins "usually", not always, fixes most display problems. Cleaning may also require removing the counter assembly form the 820, removing the counter assemblies from the counter cabinet, and cleaning the interconnecting pins on the Counter Mix and Counter assemblies. Care must exercised to ensure wires on the connecting plugs are not broken, static electrical discharge does not damage the Counter Mix and Counter PC boards, Counter Mix and Counter interconnecting pins are not broken or bent, and the various plugs are inserted correctly.

19911. TS-520 Power Transformer

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-01-29 18:42:51 UTC
From: vu2jmx
Topic: 19911 Message: 19911

Hi,

My TS-520 power trafo is busted; Where can I get a replacement, please ?

Right now I'm using a trafo from FT-101. Unfortunately the HV is insufficient. Secondly, the FT-101 trafo does not have the necessary (rather, the right voltages) taps for Final screen, Driver plate and Screen. Because of this I'm forced to use dropping resistors which are a PIN.
The 14VDC is now running on half-wave (single Diode).

Anyway, to keep it simple, I feel it is better to get the right replacemt trafo - if one is available.

Thanks and 73,
Aron.

Gordon,

A transmitter that produces 100 watts or more output on, say, 80 and
40 meters, is not an indication the finals are properly neutralized.
Power output, by itself, is not an indicator of a properly neutralized
final, maximum power output at the same point that maximum plate
current "dip" occurs is.

A few problems associated with improper neutralized finals are much
higher plate current at maximum output which leads to higher tube
envelope temperatures resulting in shorter tube life, higher stress
placed on the power supplies, instability (oscillations) in the final
amplifier resulting in possible destruction of the final amplifier's
HV RF choke, final tubes themselves, and neutralizing circuitry, and
of course radiation of unwanted emissions.

Aron,

You can either find a parts 520 or have the power transformer rewound.
For rewinding, here's a link you might try.

http://members.tripod.com/tubes_tubes_tubes/transformerrewindingservice/id32.html

I'm sure there are other transformer rewinding websites.

Using a power transformer that is not designed for nor produces the
correct AC voltages for the 520 is not a good idea.

I have a follow-up question. My Elmer has been SK for a number of years. He had a TS-520S and was largely responsible for guiding me to purchasing a new TS-530S in 1982, so now I turn to you folks. Does neutralization change with time/age? I'm wondering if I need to worry about reneutralizing the finals. Due to changing circumstances through the years, I've only had the rig on the air for less than 75hrs of actual transmitting time, so they should have lots of life left in them, and I want to protect those lives.

Thanks! Tracy Ringering, N7FPI

Yes. One thing I've noticed is that it seems to be a bit fiddly sometimes when I tune it up, and not others. I'm mostly active on 20m and 40m, and what I have found is that *sometimes* maximum output power is a little bit off the deepest dip. Leave it for an while, and it will be back to being dead on again. I don't really see why it does this, but I suspect it's heat related. I've checked for signs of distress in and around the PA cage, but there's nothing obvious. What I think I'll do is leave it on all day to get thoroughly warm before trying the neutralising again.

Plate current is normal at 200mA at full chat on 20m, and the output spectrum is nice and clean. I haven't got any screenshots off the analyser, but then I didn't spot anything notable. I was surprised at how mucky the spectrum was before I neutralised the PA.

The main reason you'd want to use it is for split frequency (duplex) operation, i.e. transmit on one frequency and listen on another. That ability is, in my opinion, of limited value in normal non-emergency use on HF. Some DX'ers use it with varying degrees of arrogance and consideration.

For example, on 80m there is a specific DX window (good). It's only 10kHz wide (not so good). It's in the Extra class segment of the band (no good at all for General class licensees).

Some DX'ers will operate split entirely within the window. Those lids I'd like to personally punch in the face - nothing like effectively comandeering virtually the entire window for yourself.

A nice thing to do if you're going to operate split is transmit in the DX window and listen in the general class segment. That allows operators who normally couldn't legally work a DX station to have the chance.

Of course a dude from NY (me) isn't going to create a pileup by calling CQ, but I still think simplex is the more courteous option on the more crowded HF bands.

Off my soapbox,

Al
AB2ZY

19917. TS-520 Power Transformer and VFO assembly

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-01-29 19:38:08 UTC
From: vu2jmx
Topic: 19911 Message: 19917

Thanks for the link Mike.

Frankly, the prices look very prohibitive!!

I should perhaps build an external PSU if I don't find the OEM part at a resonable cost.

I'm having other problems as well:

= RX seems OK but absolutely no ALC reading on TX (all bands). I'm able to get about 5W o/p on 80M with a dummy load.
= My Send/Receive switch is broken. Actually only the knob is broken.
= VFO disappears at around "300" on the dial on every band. I reckon the tuning cap needs cleaning.

Right now I'm trying to figure how to remove the VFO assembly.....

Any help on this please ??

73,
Aron.

Try looking for a shop that repairs and rewinds electric motors in your area, they might be able to help you out.

Hi,

My TS-520 power trafo is busted; Where can I get a replacement, please ?

Right now I'm using a trafo from FT-101. Unfortunately the HV is
insufficient. Secondly, the FT-101 trafo does not have the necessary
(rather, the right voltages) taps for Final screen, Driver plate and
Screen. Because of this I'm forced to use dropping resistors which are
a PIN.
The 14VDC is now running on half-wave (single Diode).

Anyway, to keep it simple, I feel it is better to get the right
replacemt trafo - if one is available.

Thanks and 73,
Aron.

real simple, external vfo, because there are not 2 IN the radio, I use for split dx operation, when you have to listen here, but transmit there (or vice versa)...

read the manual , really, simple to use, virtually the same as the radios vfo, but with selections as to which vfo is in use

Thanks to the help I received here I have My Kenwood TS830S up and working. I also was given a VFO-230. I have the manual and have read it but just don't understand why and when I would want to use it. I also need to know how to use it. Could someone please point me to some type of tutorial for the VFO-230. My Icom 737 does not have an external VFO and my old Century 21 did not have one either. I could really use some help.

Thanks

Subject: [TS-520_820_530_830] LED backfeed?

Not an operational issue, but rather one of curiosity that I'd like to fix. This group has really helped get a doa TS-530SP radio back going, and is a very valuable resource, and is very much appreciated.

I have two led's that when the switch that they indicate is off, are on very dim. They operate full brightness when their respective switch is on. The LED's are for the RF ATT switch, and the XIT switch. Not a big issue, but I'd like to know why.

I don't know where to begin checking. Thanks in advance for any advice.

Your power supply is broken. All bets are off.

> = My Send/Receive switch is broken. Actually only the knob is broken.

You might be able to get a spare from whoever you get a trannie from.

> = VFO disappears at around "300" on the dial on every band. I reckon

Seems reasonable. Does it just suddenly cut out? That could be the
plates touching.

> Right now I'm trying to figure how to remove the VFO assembly.....
>
> Any help on this please ??

Grab the TS-520S manual from KG6HAF's site. It's "close enough" for
what you want to do.

You need to be very careful removing the VFO, because the gears and dial
are quite delicate. I started by removing all the knobs and the front
panel, then unscrewing the reduction drive bearing. Then inside the set
you need to remove the fixed channel board, remove the screws that hold
the VFO bracket onto the front panel, and unplug the power and output
lead.

It's very very fiddly, but take your time, do it in a well-lit place and
have some little tubs to hold the screws as you take them out. Make
notes of what goes where, and take photos with a digital camera if
you're not sure of how something lines up. Just be careful and you'll
be okay. It's not as horrible as it looks.

Hi Aron. IIF I remember correctly, remove the 4 allen screws on the front of the VFO assembly, disconnect any wiring and remove the lamps (do not disconnect the wires, remove them from the VFO) and it slides out the front to the radio. Be very carefull if you remove the cover. You must not move any wires, and you must not get any contact cleaner in the board or the plates of the tuning capacitor. If you do, get contact cleaner where it shouldn't be, clean the areas carefully with alcohol and let dry thoroughly before re-assembly. I recommend DeOxit D5 to clean contacts and controls.

And I second the advice others here have given you. Get the transformer re-wound, or find a parts unit.

I checked, Dave, and they are just dim. The XIT being very dim, but the RF ATT light is fairly bright, and just gets brighter when the switch is "on".

Thanks Daniel; I'd seen this ad a while ago but because of shipping charges/ delay I dropped it.
I'll see if I can get something closer. US/ Canada is OK.

In fact this e-bay ad actually fits my requirement well, but....

73,
Aron.

Thanks Martin.

We have a couple of Flee-market deals coming up in the next week or two; I'll try my luck there for the Trafo.
Meanwhile I'll repair the VFO - going QRT @ 300 and also try to align the driver/final.

73,
Aron.

From: w5rkl
Topic: 19911 Message: 19929

"absolutely no ALC reading on TX (all bands). I'm able to get about 5W o/p on 80M with a dummy load."

At 5 watts output, regardless of the band or mode, you won't see any ALC. ALC is produced ONLY when the final tube grids are driven "positive" by the RF signal from the driver. When the final tube grids are driven positive, grid current flows which causes ALC to be produced and at 5 watts you won't see any ALC. It takes a lot more power than 5 watts to create ALC in the 520's final amplifier.

"VFO disappears at around "300" on the dial on every band. I reckon the tuning cap needs cleaning"

I don't believe the VFO problem is related to dirt in the VFO capacitor or capacitor plates shorting unless the VFO was physically damaged by a previous owner. I believe the VFO problem is a voltage problem. You don't have to remove the VFO to clean the VFO capacitor to frame connection, only the small panel on the side.

Since your original transformer is bad and the replacement transformer you are using does not provide all of the correct voltages, I do not recommend removing or adjusting anything until you get the correct transformer installed. I recommend finding a 520 parts radio with a good power transformer.

73
Mike

Check with Bob, KE5FTF. He has loads of Kenwood parts.
I am sure he has a transformer that is for the 520.

If you need his Email, contact me off list and I will send it to you.
73,
Gordon

19932. Led's or no Led's

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-01-29 23:29:55 UTC
From: Paul M Tas
Topic: 19932 Message: 19932

Hello all

I have a TS-700 and my lights that comes standerd with the trans. is giveing me headach's and I thought that I might just replace it with led's. Now I thought if I do the 700 why not do the 520. Now my question is would it be better to have led's than normal light bullb's in????

19933. Re: [TS-520_820_530_830] 6146B, 6146W, and the hybrids questions

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-01-30 01:59:50 UTC
From: Ron Pearson
Topic: 19848 Message: 19933

The way I understand it from what I reseached is that the 6146B can be replaced by the 6146A but the power out will drop to about 90W. However, the 6146A can not be replaced by the 6146B. I am using 6146A's in my TS-520 and it does, in fact, put out 90W.

Just to return to this for a moment - the original manual that came with
my TS-520 says it uses 6146As but the PDF available on KG6HAF's site
says it uses S2001As or 6146Bs.

Which is it? I'm using NOS 6146As at the moment and it seems to work.
It wasn't particularly easy to neutralise, though.

I checked, Dave, and they are just dim. The XIT being very dim, but the RF ATT light is fairly bright, and just gets brighter when the switch is "on".

Hi Gordon, I have some reference material for the DK-520.

DK-520 assembly & service manual, with a very nice image of the
complete DK kit:
http://www.cnyara.com/_manuals/Kenwood/DK-520.pdf

DG-5 operating:
http://www.cnyara.com/_manuals/Kenwood/DG5_User.pdf

DG-5 service:
http://www.cnyara.com/_manuals/Kenwood/DG5_Service.pdf

DG-5 Schematic:
http://www.cnyara.com/_manuals/Kenwood/DG-5_Schematic.pdf

additional reference material for other radios:
http://www.cnyara.com/_manuals

Hi Dave. While LEDs may not (yet) be able to replace all types of bulbs, for some things they are better. Flashlights are a good example. The LEDs used in flashlights are just as bright as bulbs, and their current requirements are far less.

I haven't replaced any radio dial or meter lights with LEDs, but I would think about it if it became necessary to replace them.

19939. Re: Led's or no Led's

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-01-30 17:22:59 UTC
From: Brian Hall
Topic: 19932 Message: 19939

I've replaced lamps w/ LEDs in my rigs (440S. 520S, 820S, 830S). I found a batch of "soft white" LEDs that match the warm glow of the original lamps. The ones I use are rated at 30mA, so I put a 470 Ohm resistor is series w/ the LED.

As far as I'm concerned, this is no more difficult than replacing w/ lamps and the LEDs should last forever. I bought a dozen of the LEDs for less than a batch of 5 lamps would have cost me. After replacing the dial lamps on my 820, it was comforting to know it would be the last time doing that. If you use LED's, remember they are polarity sensitive.

19940. Re: 6146B, 6146W, and the hybrids questions

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-01-30 17:55:08 UTC
From: w5rkl
Topic: 19848 Message: 19940

Morning Ron,

You are correct, the 6146A can be substituted for the 6146B. In keeping with the 6146 versions, one should NEVER mix a 6146A with a 6146B. The 6146A and the 6146B are different tubes even though they "look" the same.

However, it is acceptable to mix a plain 6146 with a 6146A since the only difference between the plain 6146 and the 6146A is the filament in the "A", the filament is more rugged in the "A".

There is no truth to the myth that simply substituting higher output tubes such as a 6146Bs for lower output tubes such as the 6146 or 6146A, will produce higher output. An amplifier's output is not based solely on the tube's output power rating. There are other factors that determine an amplifier's output power level and cleanliness of the output signal. Factors such as plate voltage, plate current, drive level, biasing, and class of operation all work together to determine the power output of the amplifier.

My local car accessories shop sells replacement car dashboard lamps which are basically a 3mm LED in a plastic blob to fit wedge-base fittings. You get them in a range of colours, including a kind of yellowy-white that's pretty close to incandescent lamps. At about £3 for a pack of two they're not especially cheap, but not much worse than "ordinary" bulbs.

Even less just before Christmas, too. You get them in sets of 19 from the kerbside recycling.

19947. TS-820S AF-AVR board

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-01-31 17:51:35 UTC
From: w5rkl
Topic: 19947 Message: 19947

I have been trying to find out why the 9VDC on the AF-AVR board changes. I have replaced the aging 14A supply filter caps (two 2200ufd at 25VDC) which helped a little but it still changes even after cleaning VR4, plugs/pins AF1 and AF2, and resetting VR4 for 9VDC on AF1 pin 1.

This morning I removed the AF-AVR board (X49-1080-00) and found C19 and R26 missing. It doesn't appear the components were removed by a previous owner but rather a change made at the factory since all of the solder connections are the same, no indication of reheating to remove the components and install the jumper. I could be wrong but...

I tried to find anything that would indicate why C19 and R26 were removed and a jumper installed and I could not find factory tech bulletin or change. So I compared numerous 820/820S AF-AVR schematics. I found "4" schematic, 2 which were the same while the other 2 were different.

Schematic 1 and 2

These schematics do not show C19 and R26. Instead it appears a jumper is connected from the junction of R38 (68 ohm) resistor and Q7's collector to R21.

Schematic 3

This schematic also does not show C19 and R26. Instead it appears a jumper is connected from the junction of R37, R38, and Q7's emitter to R21.

Schematic 4

This schematic clearly shows R26 and C19 without the small jumper.

So, not finding anything from Kenwood (tech bulletin), I wonder which schematic is the most current and correct one?

Any comments?

Hi Gordon,
My pleasure, glad it was of assistance to you!
The ole saying "there is strength in numbers" really rings true with
regard to this group.
I found a few Kenwood Service Bulletins for the DG-5 that may also be
useful:

REPAIR OF RCA PLUGS/JACKS

19949. RE: [TS-520_820_530_830] TS-820S AF-AVR board

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-01-31 18:10:15 UTC
From: david welker
Topic: 19947 Message: 19949

FYI My service manual for the Ts-820 does not show any listing for C19 or R26 in the parts list for that board.Good luck. Dave K3SI

To: TS-520_820_530_830@yahoogroups.comFrom: w5rkl@...: Sat, 31 Jan 2009 17:51:35 +0000Subject: [TS-520_820_530_830] TS-820S AF-AVR board

I have been trying to find out why the 9VDC on the AF-AVR boardchanges. I have replaced the aging 14A supply filter caps (two 2200ufdat 25VDC) which helped a little but it still changes even aftercleaning VR4, plugs/pins AF1 and AF2, and resetting VR4 for 9VDC onAF1 pin 1.This morning I removed the AF-AVR board (X49-1080-00) and found C19and R26 missing. It doesn't appear the components were removed by aprevious owner but rather a change made at the factory since all ofthe solder connections are the same, no indication of reheating toremove the components and install the jumper. I could be wrong but...I tried to find anything that would indicate why C19 and R26 wereremoved and a jumper installed and I could not find factory techbulletin or change. So I compared numerous 820/820S AF-AVR schematics.I found "4" schematic, 2 which were the same while the other 2 weredifferent.Schematic 1 and 2These schematics do not show C19 and R26. Instead it appears a jumperis connected from the junction of R38 (68 ohm) resistor and Q7'scollector to R21.Schematic 3This schematic also does not show C19 and R26. Instead it appears ajumper is connected from the junction of R37, R38, and Q7's emitter toR21.Schematic 4This schematic clearly shows R26 and C19 without the small jumper.So, not finding anything from Kenwood (tech bulletin), I wonder whichschematic is the most current and correct one?Any comments?73MikeW5RKL

19950. Re: TS-820S AF-AVR board

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-01-31 18:56:47 UTC
From: w5rkl
Topic: 19947 Message: 19950

Yep and that's the problem. I have 4 separate AF-AVR schematics, 1 shows C19 and R26 but the other 3 do not. The other 3 schematics show different wiring. One of the schematics has to be the "final" one Kenwood ended up with. Unfortunately, the board labels (X49-1080-00) did not change from one schematic to another. If the last two zeros would change, i.e., 01, 02, 03, then it would make it much easier to determine which schematic is the latest one.

I have seen this kind of schematic issue with other ham gear manuals, especially in Heathkit Circuit Description and full schematics, they are not the same. If one doesn't have the "addendum" that accompanied the original kit, it can lead to confusion as to which component is right.

I suspect the drift problem, once I find out which schematic is the final one Kenwood used, is going to be Q7 on the AF-AVR board.

Anyway, thanks Dave for your comments, it's greatly appreciated.

I am a relatively new ham with a functional Yaesu 857D [do all] mini station and very happy with it. BUT today I purchased a MINT [no marks anywhere] TS-820/VFO-820/ AT-200/MC- 50 listed on my local Craig's list. This makes an elegant but classic station with SO SO much for me to learn. My first question is where can I find a REASONABLY priced 8 pin Remote VFO Interface cable. Searcing the web turns up only an EBay dealer who is asking $44.95 plus shipping. Considering I paid $400 for the whole station I hope someone can help me with a more reasonable source.
Thanks, Jack

19954. Update Jan-31 - TS-520 Trafo and VFO

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-02-01 12:57:48 UTC
From: vu2jmx
Topic: 19954 Message: 19954

Hello and thanks to all the OM and OB for all the hints and suggestions.

I was able to fire my TS-520 using a FT-101 trafo - albeit low power.
I don't necessarily advocate this replacement because originality is
lost and quite a few changes have to be made to the voltage doubling
circuitry, screen supply etc.. (also, DC operation will not work).

Specifically to my unique situation, I did it because I picked up my
rig as a "parts" radio, therefore I had nothing to loose. Secondly, an
OEM replacement (or rewinding) would've cost me many times more than
the rig !!

Test results using a dummy load:
80Mtr - 60W CW o/p
40Mtr - 45W CW o/p
20Mtr - 20W CW o/p
15Mtr - very low
10Mtr - very low

VFO assembly was removed, cleaned and o/p adjusted to 0.9 Volts.

Front end MOSFET (Q5) 3SK35 was literally getting carried away after
about 3-5 minutes. Lot of hash. Exact replacement was not available so
I replaced it with what I had in hand - a BF966 (actually a better
spec!)

I have taken pictures of the opened VFO assembly, if anybody is
interested...

I'm still in the process of fine tuning. Will keep you all posted..

Thanks and 73,
Aron.

Thanks Gordon. I sent Bob an e-mail but did not get any reply.
On a side note, somebody on QTH.net is selling the Trafos for $50 plus $25 shipping to Canada but the seller reviews are not satisfactory. I don't want to risk it.

73,
Aron.

Topic: 19578 Message: 19957

The VFO cable uses 9-pin miniature tube type plugs. The amplifier connector uses an 8 pin "octal" tube type plug.

The octal plugs are available from many sources online. I bought one with a cable ctrain relief for about $10. However, that's NOT what you need for the VFO.

The 9-pin plugs are way harder to find and Kenwood does not sell them anymore. The only source I've found is Leeds Radio in Brooklyn. Look down near the bottom of this <http://www.leedsradio.com/parts-sockets.html> for the plugs.

Be aware that Leeds is an old time NYC radio dealer that was once located in the heart of Manhattan's glorious electronics district. It was relocated to make way for the WTC in the 1960's and is the only surviving merchant of that era that I know of.

As a result, they tend not to answer their phone when they get busy and you can't currently order online. You'll have to call, leave a message and order the old fashioned way. Or do it entirely by mail.

The really cheap lighting sets are usually just a string of 12v bulbs in series. One goes, and they all go dark.

LED ones last a bit longer, until the probably-bogus-CE-mark transformer fails.

Gordon

Gordon
Thanks
I still have the boxes and they are labelled C6 lights which I think
are LEDs but there is no transformer. Some strings are half bright
while others are dark. If I knew I could, I would repair them but I
think the process of accessing the LEDs is probably destructive, so
would like to salvage the LEDs if possible.
Do you know how to get at the LEDs?
thanks
Barry

Hard to say without seeing them, but you'd probably have to cut the
actual lamps open. It's getting pretty off-topic though ;-)

My TS820 was functioning fine two days ago. Today I turned it on, tuned up on 40m and tried to transmit, only put out a few watts on LSB. I tried CW and got my normal 100w out. I tried to tune up again and was able to get 10-15w out, again CW was 100w out. I went over the mic/connector and all connections are good. Any ideas!

cf is a canadian prefix special call prefix to replace ve or va....

if your logging program is making it as india?? check your country list maybe..

CG for VE
CF for VA
CH for VO
CI for VY

or see http://www.rac.ca/regulatory/specialcalls.htm

Topic: 19932 Message: 19964

LED XMAS lights are generally built with the LED sitting in a small plastic "holder" which is then injection-molded with the lens/base. Some of them have a removable lens but most don't. Keep in mind that these LEDs are not simply wired in series or series/parallel. There are resistors in the circuit otherwise the LEDs wouldn't function.

I've replaced several sets of panel lamps with LEDs in my TR-7950, TS-940S an even an old stereo head unit. All used so-called "wheat lamps" or "grain-bulbs" because they are about the size of a wheat kernel.

The LEDs have worked very well indeed and provide excellent lighting. However, I have found that by using a nail file to "rough up" the otherwise very smooth plastic cap of each LED helps to diffuse the light which is often focused in an LED and provides a very suitable pattern.

Have fun!

Cheers,
Robert

19970. TS-820S & VFO-820

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-02-02 00:03:09 UTC
From: km5rv
Topic: 19970 Message: 19970

I found a broken connection on the vfo cable and fixed it. I plugged the cable back into the vfo and the vfo functions properly. The only thing is I can't get the transmitter to key-up. Then I heard a loud crack and the radio was DOA. I sent the radio off and had it fixed, had the Q9 on the AF/Vox unit replaced, in the transceiver. The transceiver transmits fine without the vfo but when I plug the vfo back in nothing. I think this might have been why it blew in the first place. I have checked all connections on the cable and all seem well. Where should I go from here? Any help would be appreciated.
Tnx
KM5RV

19971. Selling TS-830 with ESP mods

Hey Angela, now that you've been around on 40 and80, you know how the bands can sound. I use 1/4 wave ground mounted vertical and it gets noisy for me even despite my station is outside the house.

I recently have been trying an antenna or beverage antenna and I find it gives me a better chance at teasing the signal out of the noise. You might look into these sometime. They are an aperiodical antenna so you don't necessarily need to prune them to resonance like a dipole or a vertical.

Someting to think about for you when you are fighting the noise. Mine are only 4 feet high and one to the north is only 118 feet long and the other is to the south only 85 feet long. Easy to do.

John.

I was unable to pick up the Texas Traffic Net (around 3873) last night. I did hear the Single Side Band net (around 3932). Unfortunately it was noisey and all they could hear from me was the first half of my call sign (KD8). Hopefully soon a contact will be made. What a Christmas gift to myself that would be. :)

19974. DK-520 for TS-520

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-02-02 05:23:25 UTC
From: Gordon
Topic: 19974 Message: 19974

I had a fellow ham ask me recently if I could build him a DK-520 adapter so he could hook up a DG-5 Digital Display to his TS-520. At first I searched around for a DK-520 unit, only to discover that they are not available and very rare. So I then decided to take the Project on. Thanks to Doug kc2pcr I was able to download the original Instruction manual to install the DK-520 using it and the supplied Schematic from Ken, K4EAA.
A trip to the Electronic store and a few hours later, I have a working DK-520 Clone.
Here is a PDF of the Project. It works Great .
http://www.n6wk.com/kenwood/DK-520-Project.pdf

Thanks again Doug for the Installation Files.

From: w5rkl
Topic: 19970 Message: 19975

The cable between the TS-820 and the remote VFO-820 should be wired pin for pin, 1 to 1, 2 to 2, etc., no shorts or cross over connection between pins on either end.

The TS-820's FUNCTION switch is normally be set to "VFO".

The VFO-820 pins are as follows:

Pin 1 - VFO-820 signal

Pin 2 - VFO-820 signal shield ground

Pin 3 - Ground

Pin 4 - 12VAC for the VFO-820 dial lamp (VFO-820 only has one dial lamp)

Pin 5 - 14VDC for VFO-820 relay. VFO-820 relay use is determined by VFO-820's FUNCTION switch position. The VFO-820 relay allows for "split" (same band) frequency use, again, depending on the VFO-820's FUNCTION switch setting

Pin 6 - 9VDC ONLY present when the TS-820's FUNCTION switch in RMT position. Applies 9VDC to both VFOs to calibrate both VFOs (zero beat both VFO signals) so both VFOs are on the same frequency

Pin 7 - Not used

Pin 8 - 9VDC to power the VFO-820 and/or the internal VFO in the TS-820. If the VFO-820 is not plugged into the 9 pin socket on the rear of the TS-820, this pin must be connected to pin 9. If the VFO-820 is not plugged into the rear 9 pin socket on the TS-820 and this pin is NOT connected to pin 9, the TS-820's internal VFO will NOT work, rendering the TS-820 "dead", doesn't work

Pin 9 - 9VDC return path for the TS-820 internal VFO and, if used, the VFO-820

The only way I can see where the VFO-820 could cause Q9 on the FIX-VOX UNIT to fail is if pins 3 and 5 on the VFO-820 or the cable itself are shorted.

I recommend checking the VFO-820 and the VFO-820 cable for shorts between pins.

Barry, OB, lucky you !!
I'll advertise and see if I can at least get a MC-50 MIC ! Of course I'll keep looking for the transformer too.
Let me see what I can get in the St. Catharines hamfest this Saturday.

73,
Aron.

Nice photos, Gordon! The rareness of the DK-520 has kept me from even thinking about getting the digital display. Now, I just might have to give this a try. Am I correct in assuming that Ken has the schematic on his site?

I am parting with a nice TS-530-S. Includes all WARC bands, no issues, no dings, just a nice looking unit that performs as it should. No filters. Asking $275.00 incldues UPS ground in lower 48. A nice Shure 444 desk mic (This is a classic World Radio edition microphone) for extra $30.00. Manual included. You won't be disapointed. Need room in shack for new rig. NO TRADES PLEASE Good in QRZ Rich K8UV

You can still get some of the complete replacement coils (with new,
unbroken
slugs inside) for about $3 each from http://www.kenwwodparts.com

A helpful hint I learned from someone who is sharp enough to have written
on
amps (and hybrids!) for QST and the ARRL Handbook for quite a number of
years -- if you heat the slugs with a hairdryer before tuning them, they
are
far, far less likely to crack (whether this is because of the softening of
the plastic for the coil form or something else I do not know).

Hi
I've had some success with this a couple of times.

A very tiny drop of super glue in the centre of the crack can hold the
ferrite core together long enough to get it out.
Only use the smallest amount of the glue, the ferrite is porous enough
to soak it up.
The trick is to use only enough to stick the core and NOT the core to
the former.
Good luck & HTH

19983. Re: [TS-520_820_530_830] cracked core on 14 mhz driver coil

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-02-02 23:17:20 UTC
From: John A
Topic: 19979 Message: 19983

Actually, the reason for using a touch of heat before adjusting the core, is because they are usually potted-in with a bit of wax. Heating the core slightly will soften the wax to make it easier to adjust and less likely to break a core. Some folks briefly touch a hot soldering iron to the core before adjusting.

Check older CB radios as well as other devices. CB radios especially those made by Cybernet often have slugs with the same thread and pitch as the Kenwood Hybrid coils.
Cybernet made CB radios such as Midland, HyGain, Krako, JC Pennys, Sears, and other store brands. Units made by Uniden such as Cobra, President, and of course Uniden usually do not have the correct slugs. However a few of the Cobras were made by Cybernet. Not the common ones such as the 29,25, 21 ETC.

While I do not wish to argue with success, I would be VERY careful with the super glue method of removal of a stuck slug. If the glue gets in the wrong place, the slug will be glued in and the coil will probably not be able to be saved.
Sometimes, I can take a very small jeweler's screwdriver and pick the small broken piece out allowing the larger piece to be worked out.
Often if most of the removed broken core is still there, it can be reinserted in upside down and will work fine.
If all else fails, very carefully remove the coil and try to remove the broken slug from the bottom.
There are a lot of CB radios lying around surplus. Working or broken, they are a good source for ham radio parts.
BTW, I haven't found the slug permeability particularly critical so if it fits I try it.

I have had very good luck with turning the broken core form the other end.
I just thread them out. I then take a core from any old coil that I have
with the same thread and install it and adjust it according to the
service Manual.
I have purchased coils from kenwoodparts.com and removed the core to
use in the coil with the broken core also .

19989. dummy load or frequency tuning.

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-02-03 04:10:52 UTC
From: wvogel67
Topic: 19989 Message: 19989

I was wondering if you tune the radio in to a dummy load(full power 100 watts) and then just pick your frequency and then use the antenna tuner to tune to the frequency?

Or is it better to just tune the radio up on the frequency you want to use, and then use the antenna tuner?

I mean if you tune the radio in to a dummy load wont the radio tuning be different when you are on a particular frequency?

Thanks

Always set frequency/band, tune into dummy load and then set tuner to match the radio. Keeps the setup happy and the smoke inside the components. Once the radio is tuned usually you can vary the frequency some without retuning, but if going from one end of band to the other or changing bands you have to retune and reset the tuner.

Unless your aerial is a particularly poor match to the radio you can tune directly into your aerial (on a clear frequency) no need for the ATU. If you tune your radio into a 50 ohm load then there will probably be a mis-match between the radio and the aerial. You can either use your ATU to then match the aerial to the radio or skip the ATU and re-tune your radio once connected to the aerial.

The output circuit of your radio will generally be able to provide a good match between your output tubes and the aerial. Might look bad on an SWR meter set for 50 ohms but it will match none the less. If you really want to use the ATU then tuning up into a dummy load first will help you get repeatable results when working with most aerials.

Sorry Lou, That is just wrong. You ALWAYS tune into a dummy load!
NEVER tune the radio into an antenna!! Operating the radio into a high
SWR will shorten th life of the tubes, and tuning up into an antenna
can cause interference to other stations, even if the frequency seems
clear.

It is the height of rudeness to tune up a radio or an amplifier into
an antenna instead of into a dummy load!

From: Jim Cannici
Topic: 19993 Message: 19993

I am cleaning up my shack and have a 820S in excellent condition for sale. I just do not have room for it anymore. Radio works well on all bands however I have never tested 160m as I do not have an antenna, but does load up on a dummy load. Has the Kenwood Trio SSB and CW filters installed. I took it off line a couple of months ago and at that time was getting very good audio reports with the Kenwood MC-50 Mike that is included. I also have the original operators manual, service manual, and Kenwood product brochure. Price is $400.00 plus shipping from 97267. Shoot me an email if interested. Thanks for reading. N7JEC

No need to be sorry Martin. Just a healthy discussion.

I did say

"Unless your aerial is a particularly poor match to the radio you can tune directly into your aerial"

and

" on a clear frequency"

The tuning process on a 520 is mainly done at low power and very briefly at full power. I'm not advocating transmitting into a gross mismatch nor am I advocating tuning up at full power. Let's not forget that the tune process only takes a few seconds at most. The idea is to achieve maximum power transfer between the pa and the aerial. This can only be done without the use of an ATU if you connect your aerial to your radio and tune-up. If you have a dummy load and an ATU, fine, by all means tune up into the load first then adjust the ATU.

Tuning up on frequency? Eventually you do have to tune-up or adjust your ATU. Let's take the example of tuning up into a dummy load? You tune-up and are happy that you are getting maximum power transfer to the load. Great. Now you have to connect your TX to the ATU and then to the aerial, you still need to transmit on air to adjust your ATU to match the output of your TX to the aerial. This can take every bit as long as tuning the transmitter.

I agree with you that tuning up for extended periods of time or on top of a contact is rude, I agree, but you still need to make sure that you have a match somewhere along the line and the only way to do that is on air. I've seen plenty of auto tuners that take way longer to find a match than it takes to tune a 520.

The point I was trying to make for wvogel67 was that a match could be achieved either way.

Lou

That is precisely how I tune up my 520S, and it has always been a quick and

simple proposition.

If you want to go a step further and be as "quiet" on the air as possible,
with the lowest possible chance of damaging your PA finals, you could also
adjust your (manual) ATU by driving it with an antenna analyzer. The one I

have (albeit not a cheap one!) puts out about 10 mW of RF, enough to adjust

the ATU with but likely not enough for much of anyone else to hear over the

noise floor on most of the HF bands. As an added bonus, because it does
real-time "sweeps" (with presets for the center and width of the current
ham
bands), you can see how wide your </= 2:1 SWR window is, or can adjust (as
you would when tuning an actual antenna) so that you are low throughout
your
area of interest in the band, or, if lucky, throughout the whole band, and
know where the ends of that range are so you can operate KNOWING you're
"ok"
within your chosen parameters (whereas tuning for lowest SWR on a given
frequency might not leave the rest of your operating range of interest all
within that </= 2:1 SWR window; there may be a better tune point so you
don't have to stop and re-tune as you move across the band, but that still
gives you a reasonable SWR for the freq you're about to work at the
moment).

Or even longer, if you have a particularly reactive antenna (i.e., too
long/short for the band by a good bit) and haven't already marked down the
general area you need to set your dials to for a given frequency.

And absolutely correct about having to tune up through the antenna. After all, we're trying to match our rig, feed line, etc. into the ANTENNA, and depending on the antenna's size, configuration, and dielectric/conductivity

profiles of what's around it (ground, air, trees, etc.), it will present a different load to the feed line at a given frequency. We often use that to

our advantage without knowing it, and there's a tremendous amount of detail

and math that ultimately goes into all of that (like most things, it is deceptively simple on the surface and enormously complex once you start to peel back the layers). This is probably not the time or place, but even with my tiny sliver of knowledge about antennas and their behavior I could write extensively on the behavior of RF, feedlines and antennas. Many brilliant men have devoted their entire lives to the study and understanding
of them, and people are STILL making discoveries and arguing out whether various theories are correct or not, even today.

> tuner to tune to the frequency?

To clarify the debate that's started brewing, I'd probably advise you to
tune your RIG (or tube amp, if you are running an amp -- same idea here)
into a dummy load, then tune THAT into the antenna via an antenna tuner IF
(IF IF IF) you use an antenna tuner. IF (IF IF IF) your antenna/feedline
is
under 3:1 SWR at your operating frequency you most certainly can use the
tank circuit (which is just another impedance matching circuit, like your
ATU -- remember, the output impedance from a tube amplifier is typically
miles away from 50 ohms, or even 300 or 450 ohms of ladder line, so the
tank
circuit is matching your PA's output impedance to your feedline or
antenna's
input impedance) and forget all about using an antenna tuner -- in fact,
it's better to do so as you will lose less of your signal in tuning
circuots, so more of it can go out into the outside world. In fact, many
trapped antennas are designed so that if the antenna is properly set up and

adjusted, you should never have any need for an outboard ATU.

> I mean if you tune the radio in to a dummy load wont the radio tuning
> be different when you are on a particular frequency?

That ends up being a pretty complicated question, but unless your antenna
is
truly a horrendous match and the antenna tuner is going through
considerable
heroics trying to make the impedance "behave" nicely, there shouldn't
really
be a great deal of difference between the best setting of your tank circuit

into a 50 ohm (non-reactive) dummy load and into an ATU tuned for 50 ohms
impedance at a given frequency for a given antenna, installation, antenna
condition, wx, etc.

If you really want to get into the nitty gritty of impedance, reactance,
antenna design and construction, antenna adjustment (tuning), and what
various ATUs and tank circuits do, drop me a line. I can get you started
on
some of it, and most of the rest can be gotten from experimentation and
books. Some of the important basics are also contained in my previous

email
contribution to this thread.

What position is the MIC gain setting (8, 9, 10 o'clock)?

I use a Shure 444 with the MIC gain set between 9 and 10 o'clock. This results in a low ALC meter indication and about 20 watts output on my "average" Drake MN-2000 and Heathkit HM-102 watt meter. A low ALC reading is what you should strive for, not a high ALC reading.

If you are using the 820's RF meter setting, understand that the RF meter in the 820 is nothing more than a "relative" RF output meter. It is not a watt meter. It's showing a low reading then clean the RF pot on the rear panel and adjust the rear panel pot for 3/4 scale reading at 100 watt output on CW. Make sure you are adjusting the RF meter pot and not the bias pot.

Don't turn up the MIC gain to get a higher output on the watt meter. You will only cause adjacent interference, splatter. If you are receiving good audio reports and normal signal level reports then there's nothing wrong with your 820.

Topic: 19989 Message: 20000

Hi Lou. I should have phrased that more diplomatically. I know that with a non resonant antenna, you need to use a tuner, and that some on-air adjustment is necessary sometimes. However, even on a clear frequency on-air adjustment of a tuner should be kept to a minimum, as you may be interfering with a QSO that you can't hear.

I do not use an automatic antenna tuner. I have an old MFJ-941D Versa Tuner II. I have made a table, and write down the tuner settings for each frequency of interest to me. That way, I can pre-set the tuner controls, and most of the time a quick check (2 very short transmissions) is all I need. Usually carefully pre-setting the tuner controls results in a 1.3:1 or lower match.

I do wish more people would keep on-air tuning and test transmissions to a minimum. I do tune up my TS-530S into a Heathkit Cantenna dummy load. I think that every Ham who has an HF radio should own a dummy load. Compared to the cost of an HF radio, the cost of a dummy load is trivial. There are plans to make dummy loads of various kinds, and building one is not difficult.

Sorry if I sounded a little harsh in my other message!

I take it one step further and use an MFJ-269 antenna analyzer to match the antenna to the 50 ohm signal. The signal from the analyzer is so low it is nearly non-existent, yet does the job well. An antenna analyzer is a very useful piece of equipment for all your antenna needs...

20002. TS 830s: Problem with VOX

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-02-03 09:32:14 UTC
From: hb9fap
Topic: 20002 Message: 20002

Hi all
I am a proud owner of a TS 830s since more than 20 years. I noticed in the past days a problem, that never happened before with my TS 830s. While transmitting on CW (with an external electronic keyer), the VOX started not working properly. I mean, by using the GAIN and DELAY all was OK, then it started to not switch anymore on Transmission. I noticed that by increasing the GAIN it was for a while working, but after a few times, there was simply no more switch by touching the paddles of the CW-Keyer. So at the moment the only way to transmit on CW is to switch the REC-SEND button to SEND before starting transmitting on CW. This is of course not very confortable.
I even noticed that the VOX does not work with the Microphone (even when on CW the VOX was still working, it was already not working with the Microphone).
Is there anybody who can have a suggestion, where the problem could be, and how to fix it?
Please apologize for my english, I hope it is good enough to let you understand what my problem is...

MANY thanks in adavance for any possible help!

73s from Switzerland, HB9FAP

20003. Re: [TS-520_820_530_830] dummy load or frequency tuning.

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-02-03 17:08:20 UTC
From: David Lammers
Topic: 19989 Message: 20003

Hi Ron,
    That is exactly the way I do it also. I am not particularly a MFJ fan but the MFJ- 269 is a great addition to the Ham Shack. When I get all the setting numbers like Martin I write them all down in a log and what ever frequency I go to I don't have to do a complete tune up just adjust ever so slightly. That way I never have to annoy anybody by tuning up on any frequency creating unnecessary QRM.

From: Ron Pearson <iamw5rcp@...>
To: TS-520_820_530_830@yahoogroups.com
Sent: Tuesday, February 3, 2009 10:33:40 AM
Subject: Re: [TS-520_820_530_830] dummy load or frequency tuning.

I take it one step further and use an MFJ-269 antenna analyzer to match the antenna to the 50 ohm signal. The signal from the analyzer is so low it is nearly non-existent, yet does the job well. An antenna analyzer is a very useful piece of equipment for all your antenna needs...

Subject: Re: [TS-520_820_ 530_830] dummy load or frequency tuning.

Hi Lou. I should have phrased that more diplomatically. I know that with a non resonant antenna, you need to use a tuner, and that some on-air adjustment is necessary sometimes. However, even on a clear frequency on-air adjustment of a tuner should be kept to a minimum, as you may be interfering with a QSO that you can't hear.

I do not use an automatic antenna tuner. I have an old MFJ-941D Versa Tuner II. I have made a table, and write down the tuner settings for each frequency of interest to me. That way, I can pre-set the tuner controls, and most of the time a quick check (2 very short transmissions) is all I need. Usually carefully pre-setting the tuner controls results in a 1.3:1 or lower match.

I do wish more people would keep on-air tuning and test transmissions to a minimum. I do tune up my TS-530S into a Heathkit Cantenna dummy load. I think that every Ham who has an HF radio should own a dummy load. Compared to the cost of an HF radio, the cost of a dummy load is trivial. There are plans to make dummy loads of various kinds, and

building one is not difficult.

Sorry if I sounded a little harsh in my other message!

Hi there,

Have you tried giving the anti-vox potentiometer on the rear panel a sweep
from endstop to enstop a few times?

From: megenr
Topic: 19793 Message: 20005

Just wanted to thank you Gordon for getting me back on the air. I received the HV Cap kit from K4eaa in the mail yesterday. Got my nerve up and took the rig apart, changed out the HV caps and bleedoff resistors, only took me 3 hours (would have taken anybody else 15 minutes, but I was scared stiff I might screw it up).

Well, fired it up and as they say, it is better to be lucky than good. I made several contacts, have my full power back and my audio reports were great. Also checked out my CW tone, which had been bad. Working good, nice clean CW tone. Thanks again for your help in getting my TS530s of 30 years back on the air...

I saw this on the Amateur-repairs site.

Bill Leahy K0ZL founded this group TS-520_820_530_830@yahoogroups.com and
the KenwoodMics group among others.
Bill was the formost expert on Kenwood Hybrids and operated a repair service
B&B Technicial Services with his Wife Bonnie, servicing most types of ham
gear.
He was an electrican at MillerCoors brewing plant in golden Colorado and
often went by Coors Bill.
Bill was a strong Christian and played gospel music.
He helped myself and countless others restoring Kenwood Hybrids.
We will miss Bill very much and his passing is a great loss to the Amateur
Radio community.

God bless Bonnie at this difficult time.

Worker dies at MillerCoors plant in Golden
By Kieran Nicholson
The Denver Post
Posted: 02/03/2009 09:34:22 AM MST
Updated: 02/03/2009 10:08:50 AM MST

A 54-year-old worker died Monday night in an apparent accident at the
MillerCoors plant in Golden.

The body of William Leahy, an electrician at the plant and a 30-year
employee of Coors, was found by co-workers at about 9:30 p.m., said
Aimee Valdez, a MillerCoors spokeswoman.

The death, being investigated by the Jefferson County Sheriff's
Office, does not appear to be suspicious, said Jacki Kelley, a
sheriff's spokeswoman.

"Leahy was well-regarded by his coworkers and our condolences go out
to the Leahy family and Bill's friends during this difficult time," a
MillerCoors company statement said.

The brewer will provide support and counseling to employees who are
impacted by Leahy's death, the statement said.

That is Horrible.
Bill was the one that invited me to this group, way back when, and asked
me to be his moderator.
I am deeply saddened by this news.
God Bless Bonnie and his Family.
Yes, His passing is a great Loss for all.

I;m sorry, but when I say 100w, that reading is from my antenna tuner meter. All my controls are set as usual, MIC gain, etc. When I try to transmit on LSB or USB the antenna tuner meter shows about 15w, in CW it shows 100w. My SSB is always around 100w out put, suddenly only 15w. I didn't explain too well the first time, sorry. I have had the radio over 1 year and have always had 100w or more output on SSB. The radio wasn't used for a few days and when I turned it on and tuned up I only had 15w out as shown on the antenna tuner meter.
So, something has made my output on SSB drop by about 85w, again CW is a good 100w out put. Could it be the driver tube? Are there any measurement tests I can make using the meter on the radio that may show what happened to reduce the power?
Help is appreciated!
Thx
Bart

20011. Frequency Display Jumping

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-02-04 03:46:20 UTC
From: n5pef@ymail.com
Topic: 20011 Message: 20011

I was wondering if anyone can help me on this problem.
I have a TS-830S and when I first turn it on the frequency display is working fine. About 10 to 15 minutes the display starts to jump around a little bit. As it warms up the more inaccurate it becomes.
The receive a transmit is not moving only the frequency display.
Is there anyone ever had this problem and or know what I should look at to fix this problem.
I would appreciate anyone who can help me with this.
Thanks and 73s

I would start by cleaning and checking all the Connections on the PLL board.
Just my thoughts.

Hello Bart,

If you have 100 watts output on CW then the driver tube is not the problem.

You might try cleaning the MIC gain control with contact cleaner then rotate the MIC gain throughout it's travel a few times then check the output on sideband again.

You also might check the final amplifier's idling current, it should be 60ma. With the meter switch set to "IP", press the PTT button on the microphone the meter should read 60ma. If it's not then with the PTT button pressed, adjust the rear panel bias pot so the meter reads 60ma. This procedure is outlined in the 820's operator's manual.

I saw this on the Amateur-repairs site.

Bill Leahy K0ZL founded this group TS-520_820_530_830@yahoogroups.com and
the KenwoodMics group among others.
Bill was the formost expert on Kenwood Hybrids and operated a repair service
B&B Technicial Services with his Wife Bonnie, servicing most types of ham
gear.
He was an electrican at MillerCoors brewing plant in golden Colorado and
often went by Coors Bill.
Bill was a strong Christian and played gospel music.
He helped myself and countless others restoring Kenwood Hybrids.
We will miss Bill very much and his passing is a great loss to the Amateur
Radio community.

My question is: under what conditions were you measuring 100W output on SSB? Were you feeding a test tone into the audio input? Or just speaking into a microphone?

Try cleaning the push-on connectors with a little of DeoXIT...
Also remove & install the mounting screws....
I do have bright steady Freq. Readout units for the TS-830S that I am selling...

20017. Re: Frequency Display Jumping

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-02-04 16:35:56 UTC
From: w5rkl
Topic: 20011 Message: 20017

In addition to Gordon's suggestion I also recommend checking and, if necessary, adjust the two AF UNIT pots for the following voltages:

1. The voltage at TP-6 should measure 9VDC. If it does not, adjust VR4 on the AF UNIT so the voltage at TP-6 is 9VDC.

2. The voltage a plug 9 pin 5 should measure 3.6VDC. If it does not, adjust VR3 on the AF UNIT so the voltage at plug 9 pin 5 is 3.6VDC.

The AF UNIT board is located on the bottom of the 830. With the bottom cover removed and the 830 upside down and the front panel facing you, the AF UNIT board is on the left closest to the front panel. There are two plugs on the rear of the board. Plug 9 is the plug on the right. Pin numbers run left to right, 1, 2, 3, etc. Plug 9 will be labeled "RF1". The 3.6VDC voltage adjust pot, VR3, is located just forward of plug 9/RF1.

TP6 is located on the left front of the AF UNIT. The 9VDC voltage adjust pot, VR4, is the "left" pot between TP6 and the front panel. The pot just to the right of VR4 is VR1, the sidetone pot.

The 830 should be in receive when measuring and, if necessary, adjusting the two pots on the AF UNIT for the corresponding correct voltages.

From: w5rkl
Topic: 20002 Message: 20020

Hi Fabio,

It appears the problem in both sideband and CW is the VOX amplifier's VOX GAIN control may be in the VOX GAIN control. If this control is dirty or set too low, either intermittent or no VOX operation will occur whether in CW or sideband. Adjust the VOX GAIN control to see if this helps. I also recommend cleaning the VOX GAIN control with contact cleaner then rotate the control a couple of time then check for properly CW break-in operation and sideband VOX. If this does not fix the problem, check the 9VDC and 3.6VDC on the AF UNIT.

To check the voltages on the AF UNIT, remove the bottom cover and turn the 830 upside down with the front panel facing you. The AF UNIT is the board on the left. There are 2 plugs on the back part of the AF UNIT. The plug you want is on the right and it should be labeled "RF1". The pin numbering is from left to right, 1, 2, 3, etc. Pin 5 should measure 3.6VDC. If the voltage is not 3.6VDC (+/-.05VDC) then adjust VR3 so pin 5 on plug 9 (RF1) reads 3.6VDC. VR3 is just forward of plug 9. Make sure you are adjusting VR3 and not VR2. The 9VDC is measured at TP6, also on the AF UNIT. TP6 is located on the front part of the AF UNIT board. If the voltage at TP6 is not 9VDC, adjust VR4, forward and to the left of TP6, for a voltage reading of 9VDC at TP6.

Once these two voltages are checked and, if required, adjusted to their respective voltages, check CW break-in and sideband VOX operation. You may need to re-adjust the VOX GAIN control. The voltage adjustments are performed with the 830 in "receive" not transmit!

What is the normal open contact for connecting to an amplifier to key the transmitter. It appears there are different plugs and pin number for each of the TS 520's 5030 530s's and sp's. I need the pin numbers for the 530SP. Jerry

Topic: 14354 Message: 20022

Hi Jerry,

First, an amplifier does not key a transmitter. The 530's rear DIN socket pins 2 and 4 are the pins you want to use to connect an amplifier's T/R relay pins to the 530's rear din socket. Make sure you use the REMOTE socket and NOT the VFO socket, they both look the same!! The VFO socket is the one closest to the right rear edge of the rear panel. The REMOTE socket is next to the fuse on the 530's rear panel.

If you don't have the 530's manual you can download it from Kenwood at the following website site:

http://www.kenwoodusa.com/Support/AMA_Radios/#_

Scroll down and you will see "Amateur Radio Manuals". Click on the drop down menu and scroll and click on "TS-530SP". Once the "DOWNLOAD" appears, click on "DOWNLOAD" to get the manual. The REMOTE DIN socket pin connections are on page 24.

What amplifier are you considering using with your 530? Most modern amplifiers will work fine with the 530. However, there are some older vintage amplifiers such as the SB-200 that have use high voltage on their relays, 100VDC or higher. Just be sure you are aware of this when using older vintage amplifiers with the 530.

Wondering if I'm on the right track in ordering a new driver tube for my 530. When I have the rig in the TUNE position, and try to peak the alc with the drive control, I get an almost full scale reading, and then a rapid dropoff . In addition the Ip dip is relatively broad, (not real sharp), and the load has a very broad "peak"-meter scale on rf. Am I headed in the right direction??? Thanks in advance for any help.

I think that depends what band you're on. My TS-520 has a pretty broad peak on the drive control, with a narrow deep dip on the anode current when I tune up on 14MHz, but on 3.5MHz the drive control has a strong narrow peak and only a very shallow, vague dip on the anode tuning on 3.5MHz.

It doesn't seem to stop it working, it just means I need to be a bit careful when I'm tuning up. No doubt someone will tell me why this is a terrible problem that must be attended to right away...

Gordon

Hi Jeff,
I use an SGC SG-231 and it's quick, quiet, and remembers previously tuned frequencies for even faster response. I'm running a TS-530S and Icom IC-725 on a 100 ft. loop antenna. I can go from 160m-10m as quickly as I can retune the rigs (60m is also supported, but I have no such radio). Your G5RVs would be pleased by the addition and, no, I do not own stock in SGC.

I should follow-up by saying that to use the SGC, you'd have to cut off your coax and run parallel feedline. But if you do that, you'd probably be in good shape.

Well, it's two years later. Soon after posting that in 2007 we packed
up and moved. I've got most of my radio shack put back together,
better than ever.

Now I've pulled out the TS-820 again. And true to my prediction I
don't remember much of anything.

So I'm going to go back over the old threads and see where I left off.

I have a question about the "Adjustments" section in the TS-820 service manual.

I'm looking at section 5.2.1: "Adjustment of VCO Coil" on page 52 of the service manual.

Under "Formal adjustment" at the bottom of that page it talks about a procedure of setting the switch to "TUN", jumpering TP1<->TP2, taking a frequency reading at TP5, jumpering TP2<->TP3 and comparing frequency.

What is that doing? In my case it seems like my TP2<->TP3 readings are all greatly different than the first readings, some bands worse than others.

Good morning Mike
MNI TNX for your very precise description on what to do! I will try
to do what you told me as soon as I can and will let you know about,
hopefully, improvements! However, yesterday evening I was checking
again my ts830s and, I noticed that the VOX works on SSB with
microphone... I noticed that there was a problem in the microphone not
working properly. So, at least the VOX works with MIC. I tried several
times with CW, but it just doesn't work. I measured the voltage at the
CW jack key in the bottom panel and it is seems to be correct with the
65 V.
I will try as soon as I can to do what you proposed me to do (I just
read this wednesday morning your email, I am at QRL).
Wishing you a nice day and greetings from snowy south Switzerland!

I'm looking for a VFO 230 for my 830s. If you have one available please
let me know. I can pay via PayPal

73, W7TSR, Tim

20040. Re: K0ZL (SK)

Bill will surely be missed, he was a true ham, always looking to help
& mentor others. He helped me many times, and sent me parts.

Condolences to his family
Rest in peace Bill,

Clint

20041. Re: TS 830s: Problem with VOX

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-02-05 21:16:09 UTC
From: w5rkl
Topic: 20002 Message: 20041

Since the VOX works fine in sideband but not in CW then check the
voltage at TP2 on the AF Unit. In receive the voltage at TP2 should be
zero. With the CW key closed in CW mode the voltage at TP2 should be
.5VDC. If the voltage at TP2 remains at zero with the 830 in CW mode
and the CW key closed, then I suspect diode D9 is bad, most likely open.

TP2 is located in the middle of the AF unit board. It should be easy
to find.

I know how the snow can get in Europe, I lived in a small village near Stuttgart called "Leonberg", 12km from Stuttgart, for 5 years (Feb 1999 to June 2004). We did not get the same amount of snow Switzerland does but we did get quite a bit. I was "DA1TNJ" during my time in Germany. Loved it there but my job ended so I had to return to the states.

Ich spreche kein Deutsch sehr gut. Ich liebe die deutsche Sprache, aber es war schwierig für mich zu lernen. Meine Frau spricht fließend Deutsch, so dass einiges dazu beigetragen.

Ok, cleaned the switchs using Deoxit. I checked the amplifier's
idling current, it's right on 60ma. What about the mic? I don't have
a spare one to test with, is there a quick test I can do to rule it
out? Touching 2 of the mic connector prongs on the mic connector,
something like that? Anything that would rule the mic out? I guess
I'm thinking like a troubleshooter now, got to have voice "in" to get
"rf" out :)
I appreciate your help in getting to the bottom of this.

Touching the mic audio input should give you some output. Radio would have to be keyed when touching the audio in. Not sure what level, but would think that should work. Mike probably has better idea as I'm not familiar with the 820.

Bart,

Yes, you can do the finger on the mic pins test in USB or LSB to see
if output occurs. The 820 should be tuned up properly for maximum
output then switch to USB or LSB, meter in RF, and flip the SEND
switch up. Press your thumb firmly against the mic socket pins with
the MIC gain set at 11 o'clock. You should see a "slight" rise in the
RF meter if everything is working properly. Do not look for a change
(rise) in IP current or an ALC meter indication because you won't see any.

I have done this before with my 820 and the RF output is very low but
you should be able to see it on the 820's RF meter. If the RF output
meter does not show a rise, either the RF meter pot on the rear of the
820 is set too low OR there is a problem in your 820.

73
Mike

Please note that with 100 w out on CW you will only get 15 to 35 watts on a analog (needle) type meter while operating with voice on SSB. You will still be peaking the same as on CW but the meter needle will not be able to keep up with it. That is why there is such a thing as a peak reading meter. However I prefere to use a scope.

You could try to touch mike pin 1 with a screwdriver with your finger on it to inject garbage into the mike input as a crude test signal. do this with the processor off and the mike gain fully up. Then note the watt meter reading. Also not the IP reading while doing this. A very steady pure tone of between 400 to 1500 Hz will work better. Do not do this for more than a few seconds as it pushes the tubes just like in CW.

What mike are you using> If it is dual impedance such as the MC-50, might it have accidentally been changed to low impedance? It should be on high impedance.

Could the change be that you processor has accidentally been turned on or off when the problem developed or could the processor be turned down? If you go AHHH into the mike, what does the ALC meter read ?

Ok, cleaned the switchs using Deoxit. I checked the amplifier's idling current, it's right on 60ma. What about the mic? I don't have a spare one to test with, is there a quick test I can do to rule it out? Touching 2 of the mic connector prongs on the mic connector, something like that? Anything that would rule the mic out? I guess I'm thinking like a troubleshooter now, got to have voice "in" to get "rf" out :)
I appreciate your help in getting to the bottom of this.

20047. Re: TS820

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-02-06 02:16:03 UTC
From: bragucci
Topic: 9983 Message: 20047

Thanks to everyone for their help! I found if I shut off the speech processor my SSB goes back to the normal 100w output, turn it back on and the output drops significantly. So, my guess is give the switch a shot of deoxit? Would I have better luck opening the radio from the bottom cover to access this? And if after cleaning I still have the problem what else can I check with the switch?
Thx
Bart

Topic: 9983 Message: 20048

Yes bart,
A dirty Processor switch is a common problem on some of these old
Radios. A good shot of De-Oxit then work the switch in and out a few
times, should make it good as new for a long time.
Let us know how it works out.
73,
Gordon
N6WK

20049. TX Freq Drift on TS520SE during PSK31 operation

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-02-06 18:34:15 UTC
From: robin_joe2000
Topic: 20049 Message: 20049

Hi all, I just started using my old TS520SE for digital mode operation. RTTY seems to work fine - but I'm seeing signs of drift with PSK31 mode. Presumably this is due to drift in the VFO reference circuit. It seems worse on 20M than 40M which supports this theory. After calling CQ (perhaps 15 sec of transmission time) I can watch receive signals drift on the order of 15-30Hz at 15M, which is enough to play havoc with PSK31 signals. I DON'T think this is happening due to my computer soundcard! This happens after significant warm up time (hours). My shack is in a cool portion of my basement, it is between 55 and 60F. The apparent drift happens over the seconds timeframe - my waterfall display squiggles left and right noticably over the first 5-10 seconds after transmission.

Every time I call CQ, the replying station seems to be off my channel, meaning I can't hear replys. In fact, I was trying to reply to a CQ last night, was unsuccessful, then heard the resultant conversation where they were talking about the ham who was drifting all over the place. Embarrassing!

Do any of you successfully run PSK31 on this rig? Any success on 20M, or am I limited to lower frequencies, or just limited to RTTY? Any suggestions or recommendation are welcome.

Joe,
I don't think the transceivers of that age, be it Kenwood or Yaesu are usable for PSK. I can be wrong in this, but the culprit is the analog VFO, that always wanders around, even after a warmup period.
Better get yourself a set with full digital frequency generation.
I myself use a IC756, that is stable within 2 hz over a day period, even without high-stability unit.
I like the older sets too, but they were not designed for this kind of stability. They were outstanding for RTTY the oldfashioned way with a Teletype 15, I used that in the mid-eighties myself.

From: martin
Topic: 20049 Message: 20051

Hi. I have used PSK31 and made a fair number of QSOs with my TS-530S.
I know its not the same radio, but the specs on stability are the
same. I seem to remember others using the TS-520 series radios on PSK
successfully. It may be possible that your radio is not reaching a
stable operating temp, or maybe a component in the VFO circuit causing
the instability that you are seeing.

You can measure the amount of drift that you have in the following manner:

Tune the radio to WWV, and start your PSK software. Tune the VFO so
that byou see the WWV carrier on the waterfall display. Click on the
center of the carrier., and write down the time and the audio
frequency shown in the program. Check again at 15 minute intervals,
and write down the time and audio frequency. After about 20 minutes
or so, the drift should be minimal(50Hz or less in any 15 minute
period after warm-up)

Since WWV is a frequency standard, what you are seeing is the VFO
drift (and and drift in the sound card)

But if you had favorite freqs that you used for digital modes,
couldn't you use fixed crystals? No drift that way.

20053. Re: TX Freq Drift on TS520SE during PSK31 operation

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-02-06 21:33:00 UTC
From: w5rkl
Topic: 20049 Message: 20053

Most likely the drift in the 520SE is caused by the 9VDC supply. The VFO is powered by the 9VDC and if it's unstable the VFO will be unstable which leads to drift in the 520SE in both transmit and receive.

Measure the voltage on the FIX CH AVR Unit's "9" connection, it should be 9VDC. If it's not, adjust VR1 on the FIX CH AVR Unit for 9VDC on connection "9". Monitor the voltage and I suspect it will drift "upward" in voltage.

It is quite possible that zener diode D3 on the FIX CH AVR Unit is failing which is affecting the stability of the 9VDC supply. A replacement for D3 is a 1N5234B available from Mouser Electronics for 5 cents.

I also highly recommend replacing all of the power supply filter capacitors. The 520SE is 30 years old or older and the filter capacitors should be replaced. If you plan on keeping your 520SE this would be a good investment.

Yes, that is true but, unfortunately, that would not correct the drift
issue.

I use my TS520 for PSK31. It drifts pretty drastically for a few
minutes after switch-on, to the extent that everything moves diagonally
in the waterfall! By the time the PA valves have warmed up the VFO is
nice and stable and it only drifts very very slowly, if at all.

Gordon

Well, it would to the same extent that using crystals would prevent any rig drifting, surely?

I thought the whole point of the fixed frequency crystals was that it used those instead of the VFO? You could crystal it up for the centre frequencies of the common PSK areas and tune the rest in fldigi (or whatever software you use).

> Well, it would to the same extent that using crystals would prevent any rig drifting, surely?

That is true IF the crystal oscillator's power supply is stable. A crystal oscillator can drift if the supply voltage is not stable.

> I thought the whole point of the fixed frequency crystals was that it used those instead of the VFO?

That is true.

> You could crystal it up for the centre frequencies of the common PSK areas and tune the rest in fldigi (or whatever software you use).

Yes, that would work.

Although operating crystal control can provide a stable transmit signal, the operator may also want to operate other modes as well using the VFO. A VFO that drifts can be quite frustrating regardless of the mode.

Gordon, I was not discounting your suggestion of using crystals as a means of a stable signal. I only meant that using crystal control, although a good idea, didn't fix the VFO drift.

Yep, that should not be happening.

> Do any of you successfully run PSK31 on this rig? Any success on 20M,
> or am I limited to lower frequencies, or just limited to RTTY? Any
> suggestions or recommendation are welcome.

My TS-520S is good for PSK31, and I've used it for that for a good while.
The VFO does drift slowly for a while after I first fire the rig up, but it

is very slow, on the order of 10 hz every minute or two, and stops after
the
rig is well warmed up. It's always in the same direction, and is steady
(i.e., it starts out at a given rate in a given direction and slows
steadily
until it stops drifting, probably 20 min. to half an hour after switching
the rig on). Sounds like you have an issue if the rig is drifting
erratically, in both directions, and doesn't stabilize as the rig's temp
stabilizes. Can't help you diagnose it, but I can tell you that something
ain't right, and that once you find and sort it, you should be very good
for
PSK31. No one has ever really complained about the mild drift I get when
first operating, and it's slow and steady enough that it's easily tracked
by
both myself (to correct) and stations I'm QSOing; with a 6 db down point on

my tightest AF filter of 100 hz knee-to-shoulder I have never had a problem

seeing a station in QSO with me, even if I have been sending for several
minutes at a time not long after firing the rig up.

Of course the usual provisos apply re: not using more than about 40-50
watts
out with the rig, since it was designed for lower duty cycle apps like CW
and SSB, and PSK is 100% duty cycle and would be very hard on the PA finals

if driven at high power. If you have a decent antenna, you shouldn't need
100 watts anyhow, at least not on digital modes; to me that's one of the

joys, that almost everyone is working barefoot so even though you may not
be
able to afford a kilowatt and a half linear, you can still work DX with the

best of them if your operating skills and antenna system are up to snuff.

I've got about 150 PSK contacts that would say you're wrong. ;) That's in

a total span from the start of October 2008 until mid-January of this year
(I've been mostly working SSB on my Orion since I got it, but have the 520
again hooked up in the shack and will be working data modes again shortly,
with both it and the Orion).

> I can be wrong in this, but the culprit is the analog
> VFO, that always wanders around, even after a warmup period.

If your Kenwood VFO wanders after the warmup period, and/or is erratic, I'd

say there is something wrong with it. Chances are good that most
mechanical
VFOs will need maintenance before they are as old as the ones in our rigs,
and many of the Kenwood hybrid rigs have gotten none since the rigs were
new...

Hi Bob.

The freq.readout units for the TS-830S that you are selling, how much are they?
Thanks.

Try cleaning the push-on connectors with a little of DeoXIT...
Also remove & install the mounting screws....
I do have bright steady Freq. Readout units for the TS-830S that I am
selling...

20061. TS-520 - 40Mtr Driver slug

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-02-07 10:11:20 UTC
From: vu2jmx
Topic: 20061 Message: 20061

Hello everyone,

My 40 Mtr driver slug rotates freely without moving up or down.
Slug is not broken or cracked and I don't see any room on the other
side to push it back (out). I got this rig in this condition. I've
followed all the guidelines available here on this forum and elsewhere -
verbatim. I use the right tools for tuning.

A search for a similar thread did not yield any results, unless of
course I missed something..

Thanks in advance for your time.

73,
de Aron VU2JMX.

Is it right at the bottom? Perhaps that is the wrong slug that's been
dropped into the hole and is just spinning inside the threads?

Gordon

Yes indeed, particularly for other users (as the chap has mentioned himself - note to other ops, when you slag off someone's operating practices the chances are they can still hear you).

> Gordon, I was not discounting your suggestion of using crystals as a
> means of a stable signal. I only meant that using crystal control,

It wasn't me that originally suggested it. If his VFO is drifting that much, there is definitely a problem that needs sorted out. It would be interesting to put a scope on the power supply to the VFO - my money is on either a sagging power supply or RF getting in somewhere it shouldn't.

Gordon

If its really loose, maybe try tilting the radio upside down while trying to lightly turn the slug to see if you can work it out.

I own a TS-520 that I purchased in the early 80's. I have made 100's of PSK contacts with it in the last few years and many RTTY contacts before that. I have not ever experienced any drift in the radio. Many contacts are surprised I am operating PSK with a radio made in the 70's. They are surprised because the signal quality they see on their waterfalls is excellent, comparable to modern rigs. This radio also produces superb SSB audio.

You don't need a digital display to operate. You tune the rig to get the most signals inside the bandwidth using the waterfall display. It is irrelevant what the actual frequency is. You are zero beating to a range of signals and then you use the PSK software and the sound card to pick the Hz of the incoming signal.

I have found one of the most critical settings is the ALC. When transmitting the ALC should be close to zero. It is very easy to overdrive the radio with your soundcard.

I have never touched the innards of this rig. I can still get 100 watts, but operate digitally at 50 watts or less. I still am running the original finals.

My thinking is that you have to run this rig on a regular basis to keep it running well. If you don't move the VFO or knobs for a while, it seems to run less well.

As long as this rig performs, I will not be dinking with any of the internal components. I know when I remove the cover for any reason, it might be asking for more trouble than it might be worth.

Thanks to everyone who helped me. I gave the processor switch a good shot of Deoxit but it didn't help. With the processor turned off I show about 55w output peak, nowhere near the 100+ I used to get. At this point I think I'll get it fixed by a pro. I'll check the web and see who does these repairs. Seems like it's beyond my ability.
Thanks again

Speaking into a microphone with the watt meter on my antenna tuner,
100w peak is my usual on SSB.

From: w5rkl
Topic: 9983 Message: 20068

Are you sure the problem is your radio and not your watt meter? Is it possible you have an average watt meter and not a PEP watt meter? If you have an average watt meter you will not see 100 watts output on sideband. If you see 100 watts output on sideband with an average watt meter your MIC gain is set way too high.

Good luck.

Unless you have a true peak reading meter that is calibrated for each band
(the cheapest ones I have seen that fit this description cost about $200;
if
you aren't sure what I mean, you are very unlikely to have one in your
possession!), your "peak" reading is a lot lot closer to average power out.

What band are you making these measurements on? In reality, you should be
seeing somewhere around ~60 watts average with the processor at best, and
~20-30 watts without the processor. Since meters that are not filtered and

calibrated by band will pretty mcuh always read differently on different
bands for the same actual power output, generally higher readings at higher

frequencies IIRC, you may well just have a typical inexpensive meter and
are
onn a band for which it is not calibrated, and what you are seeing with the

processor off may well be normal.

I would agree, however, that you have a problem with the processor of some
sort that needs repair. But you may well find that the numbers you got
before the problem and the number you're getting now with processor off are

accurate in a relative sense, but are way off in an absolute sense.

Even the best peak meters will show very few needle deflections all the way

to 100W when you're running SSB and are actually peaking at 100W PEP, since

the human voice doesn't often produce sound levels high enough to drive the

finals all the way to their limit. I'll wager that if you key-down after
tune-up at full power in CW you will see more than 100W on your meter; is
that the case? If so, then you KNOW your meter is not accurate.

Do you have a true peak-reading meter? Nearly all of them have a switch to

allow average or PEP readings to be taken.

Hi Mike:
I measure with the watt meter on my antenna tuner. A MFJ-969, it measures both peak and average. Anytime I mention 100w I mean 100w peak on the meter. I've had the radio about two years and no chnages have been made, same mic, antenna, antenna tuner, etc. On SSB I always show 100w+ peak on the antenna meter,now I have about 35-55w peak, and to get that I have to shut off the speech processor which I usually keep turned on. With the processor on it barely moves the meter. But, CW shows my normal 100w output. So something has gone wrong somewhere in the radio. I cleaned all siwtches with Deoxit, giving special attention to the processor switch, no change. Last night I did try transmitting again, and turned on the processor, it did work for a short time, maybe 20min, then I had to shut off the processor again to get the below normal output. It's frustrating :(I probably didn't explain the situation too well the first few times. But summing it all up the radio was working great until last week, I tuned up and had no SSB output, CW was normal. Shutting off the processor got me about 35-55w output peak, not the normal 100w peak, again using my antenna tuner meter to measure. If you have anyother ideas let me know!! If not I need the name of someone who fixes these older rigs. Maybe with a little bit better than a 2-3 month backlog :) I appreciate your help :)

Thx
Bart

It's unlikely that MFJ makes a true peak-reading meter. If it is an
electromechanical meter movement and there's no knob to adjust peak hold,
then the meter will very rarely show actual peaks, because the movement
can't respond anywhere near quick enough to indicate a peak before the peak

driving the meter has ended.

> On SSB I
> always show 100w+ peak on the antenna meter,

The meter is very unlikely to be accurate on the band in question, since
your radio is pretty unlikely to ever be putting out in excess of 100W.
Does
it read the same with the same input levels on all bands?

> now I have about 35-55w
> peak, and to get that I have to shut off the speech processor which I
> usually keep turned on.

This is typical of what you will see on a meter that doesn't really display

PEP when you shut off the processor, as the average power level falls while

the peaks stay about the same when the proc unit is shut off.

> Shutting off the
> processor got me about 35-55w output peak, not the normal 100w peak,
> again using my antenna tuner meter to measure.

Since this is almost certainly NOT a true peak reading meter, that's
exactly
what you would expect to see. That's why the processor is there, and why
people who don't have processors use compressors on their mic audio
sometimes, as the average power level gets raised by these devices.

I'm going by what the meter read before the problem started compared to what it reads now. Before the problem started it read 100w+ peak on SSB, now it reads maybe 55w peak, that tells me that something has changed. If the meter is accurate doesn't matter, I use it as a baseline, so if I seeing 100w+ peak on SSB, and now only see say 55w peak, that means something is wrong. The meter is on the antenna tuner, MFJ-969. It probably isn't accurate, but if I've always had 100w peak for the last 2 years, then suddenly have 55w peak that tells me I have a problem with output.
I'm using the same mic, antenna, etc as I've used for the past few years, when I transmit on SSB I watch the meter on the tuner, I know what is "normal" for my radio, when I transmit and see something different then I normally see then it tells me something isn't right :)

Thx
Bart

20074. Re: [TS-520_820_530_830] Re: TS 830s: Problem with VOX

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-02-07 20:23:01 UTC
From: Fabio Scherrer
Topic: 20002 Message: 20074

Hi Mike
First of all, let me resume the main problem, maybe I never mentioned it properly.
VOX is normally working in SSB, I mean, when I switch the vox control (gain and delay) on the front panel of the ts 830s, it works correct.
When I want to transmit on CW, using the VOX with gain and delay from front panel, it does not switch into TX when I use the electronic paddle (Bencher-similar CW-Keyer). To transmit on CW I have to switch manually the switch in the front panel from REC to SEND. But, I don't hear the SIDETONE coming from the TS 830s (sorry, I didn't know until yesterday what is in english the "sidetone"... now I understood it, or at least I think to have it understood...), so in other words, on RX when I am keing the CW, I don't hear any tone in the "background".
I did what you suggested here below in your email and the reults are the following:
I have been checking the voltage at TP2 of the AF unit: in RX the voltage is zero, if I go on TX (= I switch from REC to SEND and I send a tone from the CW Keyer) TP2 remains at zero, so not going to 0.5 VDC on TP2. I have been checking Diode D5 on the AF unit, but it seems to be OK. I have measured the Diode D5 without desoldering it from the AF Unit and it does seem to work properly.
Refering to your previous email (where you suggested to measure D9 at TP2... please apologize, but I just have read that email of you, after having reassembled the TS830s, so I didn?t check it until now... I will most probably do it tomorrow and then let you know if the Diode D9 is working properly or not. In any case, what seems to be for sure wrong, is that Voltage at TP2 while Txing does not show 0.5 VDC, but zero.

I don?t
know if you have any additional suggestion before I will measure if D9 is OK or not. In any case, once more MNI MNI TNX for your great help and congratulations to be very precise on describing where to find what in the AF units, I really appreciated it a lot! I am not experienced at all on opening a transceiver, so you can imagine, I am very careful, because I don?t want to create more problems instead of solving what is not working at the moment...

Mike,
Thanks so much for your great help, I wish you a nice weekend and hope to read you soon. When I have additional information after after having measured D9 on AF Unit, I will let you know.

Subject: Re: [TS-520_820_530_830] Re: TS 830s: Problem with VOX

Hello Fabio,

Since you said VOX is working in sideband mode but not CW, I suggested checking the voltage at TP2 on the AF Unit. If diode D5 is good, pressing the CW key in CW mode should cause the voltage at TP2 to change from zero to .5VDC. If diode D5 is open, the voltage at TP2 will not change when the CW key is pressed, it will remain at zero. Diode D5 is a 35VDC 300ma switching diode. Any 35VDC 300ma or higher switching diode should work fine as a replacement.

If diode D5 is open you will still hear the CW sidetone in the speaker/headphones but the sidetone audio signal will not be rectified by diode D5 in order to control transistor Q12 and the circuits after transistor Q12.

All of the above information is assuming diode D5 being open.

Fabio, will a straight key work using the VOX? If so, it could be
that the keyer doesn't key the higher voltage of the 830.. I had to
build a keying relay to make mine work. (The keyer output keys the
relay and the relay keys the 830) Then I bought a "Keyall" kit from
Jackson Harbor Press. http://home.att.net/~jacksonharbor/keyall.htm

"To transmit on CW I have to switch manually the switch in the front
panel from REC to SEND. But, I don't hear the SIDETONE coming from the
TS 830s"

If the CW sidetone oscillator is not working when the CW key in CW
mode is pressed, the 830 will not change to transmit. The CW sidetone
activates the 830's VOX circuit in CW mode which changes the 830 from
receive to transmit.

It doesn't matter whether the key is a straight key, keyer, or any
other form of CW keying, the CW sidetone must be present at the input
to the VOX circuit for the 830 CW break-in to work.

I'll check the 830's schematic and try to find where the sidetone
problem is. Fabio, I received your e-mail and will respond later this
evening or tomorrow morning.

From: james eaton
Topic: 19717 Message: 20077

Actually it is only 1 and 1/2 tick marks off. The band switch is on 3.5 Mhz and the dial indicates 180.5 so it need to only move 1.5 tick marks. Hold the large knob so it does not move and move the knurled knob behind it counter-clockwise to align with the readout. A bit tricky, but I just recently re-aligned mine. What the responder was referring to would apply if you had taken the whole VFO apart. with the VFO hundreds dial at 0, the 5 should show in the window next to 90 in the units dial.

Hi Mike,

This problem was reported some time ago - 2 or 3 months I guess.

The solution given by Dave is OK for the kHz dial in the lower window - it's
the way you have to calibrate the kHz dial reading per the user's manual,
but not for the 100 kHz dial in the upper window, and your picture show
clearly the problem.

Search the files with ' dial ' and you probably will find it.

As I remember, the procedure is covered by the TS-820 service manual you can
download for free at several places on the web.

It's a little bit tricky but not that difficult.

Good luck & 73's - Daniel, ON5PY

> changed.

Well, obviously. You turned off the processor. What you are seeing is
normal on a typical non-peak reading meter when you go from processor on to

processor off.

Clearly there's a problem with the low output with the processor on, but
what you are seeing with processor off and how it impacts your signal is
exactly what you should expect to see.

> if I seeing 100w+ peak on SSB, and now only see say 55w
> peak, that means something is wrong.

Absolutely incorrect. I suggest you look into what the processor does and
why one would be included on the radio. The behavior you are seeing is,
again, perfectly normal.

Hello again Fabio,

The side tone not working is the reason that the VOX isn't working on CW as Mike correctly states.

I've seen this before on a TS-830 and in that case it was caused by loss of the STB voltage, R13 (100k ohms) on the rectifier board was open circuit.

The STB voltage should be somewhere around 100 volts so you can easily check that, if it's around zero volts then check R13 on the rectifier board.

I remember this fault well, there was no obvious sign of stress on the resistor and no obvious cause of its failure, simply replacing the resistor did the trick.

Hope this helps Fabio,

73 de Adrian / ZS1TTZ

Hi Fabio,

You said you do not hear the CW sidetone in CW mode when pressing the CW key. This is good information as it tells me the CW sidetone oscillator in your TS-830 is not working which is why your? TS-830 is not switching to transmit when you close the CW key in CW mode. This also tells me why the voltage at TP2 does not change from zero to .5VDC when the CW key is pressed. Now that we know what circuit is not working we can investigate further to find out why the circuit is not working.

I will get back with you tomorrow. I have some checking to do so until then, have a nice evening.

Hi Mike

First of all, let me resume the main problem, maybe I never mentioned it properly.

VOX is normally working in SSB, I mean, when I switch the vox control (gain and delay) on the front panel of the ts 830s, it works correct.

When I want to transmit on CW, using the VOX with gain and delay from front panel, it does not switch into TX when I use the electronic paddle (Bencher-similar CW-Keyer). To transmit on CW I have to switch manually the switch in the front panel from REC to SEND. But, I don't hear the SIDETONE coming from the TS 830s (sorry, I didn't know until yesterday what is in english the "sidetone"... now I understood it, or at least I think to have it understood...), so in other words, on RX when I am keing the CW, I don't hear any tone in the "background".

I did what you suggested here below in your email and the reults are the following:

I have been checking the voltage at TP2 of the AF unit: in RX the voltage is zero, if I go on TX (= I switch from REC to SEND and I send a tone from the CW Keyer) TP2 remains at zero, so not going to 0.5 VDC on TP2. I have been checking Diode D5 on the AF unit, but it seems to be OK. I have measured the Diode D5 without desoldering it from the AF Unit and it does seem to work properly.

Refering to your previous email (where you suggested to measure D9 at TP2... please apologize, but I just have read that email of you, after having reassembled the TS830s, so I didn?t check it until now... I will most probably do it tomorrow and then let you know if the Diode D9 is working properly or not. In any case, what seems to be for sure wrong, is that Voltage at TP2 while Txing does not show 0.5 VDC, but zero.

?

I don?t
know if you have any additional suggestion before I will measure if D9 is OK or not. In any case, once more MNI MNI TNX for your great help and congratulations to be very precise on describing where to find what in the AF units, I really appreciated it a lot! I am not experienced at all on opening a transceiver, so you can imagine, I am very careful, because I don?t want to create more problems instead of solving what is not working at the moment...

?

Mike,
Thanks so much for your great help, I wish you a nice weekend and hope to read you soon. When I have additional information after after having measured D9 on AF Unit, I will let you know.

?

Subject: Re: [TS-520_820_530_830] Re: TS 830s: Problem with VOX

Hello Fabio,

Since you said VOX is working in sideband mode but not CW, I suggested checking the voltage at TP2 on the AF Unit. If diode D5 is good, pressing the CW key in CW mode should cause the voltage at TP2 to change from zero to .5VDC. If diode D5 is open, the voltage at TP2 will not change when the CW key is pressed, it will remain at zero. Diode D5 is a 35VDC 300ma switching diode. Any 35VDC 300ma or higher switching diode should work fine as a replacement.

If diode D5 is open you will still hear the CW sidetone in the speaker/headphones but the sidetone audio signal will not be rectified by diode D5 in order to control transistor Q12 and the
circuits after transistor Q12.

All of the above information is assuming diode D5 being open.

Bart,

I apologize if this has already been suggested, but I've been behind on my email lately. At any rate, per Kenwood's service bulletins for the 820, for the symptom of having very low RF output only when using the RF speech processor, one should check a bad Q30 (2SC733) on IF (X48-1150-00).

Hope that helps,
Jeramy / W5XTL

Hello Fabio and Adrian,

I agree with Adrian, resistor R13 (100K) can easily prevent the sidetone from operating. Good job Adrian.

Be very careful when measuring voltages in the TS-830 with the power cable plugged into the wall. The Rectifier Unit PC board has very high voltages which can KILL YOU!! BE SAFE!!! Take your time, do not be in a hurry.

Unplug the TS-830 from the wall outlet, remove the covers, turn the TS-830 so the bottom is facing up and the front panel is facing you.

Locate the Rectifier Unit PC board which is to the "left" of the power transformer. Looking down at the Rectifier Unit PC board the "STB" pin is just forward of the relay and slightly to the left. Resistor R13 is mounted just forward of the relay.

Plug the TS-830 power cable into the wall outlet and turn the 830 on. Measure the voltage on the "STB" pin. If R13 is open or bad there will be very little or zero volts on the "STB" pin.

Again, be very careful measuring voltages on the Rectifier Unit PC board. There is high AC and DC voltages on this board!! BE SAFE!!.

Again, Adrian, good job!!

Topic: 20061 Message: 20084

QSL and T U Dan and Gordon.

Dan:
The slug is not loose enough to fall out from either direction. It just keeps rotating in the same place. I'm planning to make a stiff 'U' out of some non-metal and see if I can push it out from the other end while I rotate it.

Gordon:
The slug is almost in the center I suppose. By the looks of it the slug seems to be from the same lot.

On a different note, Getting (just) the MC-50 mic proved to be more difficult than I imagined. I therefore picked up a YD-148 (50K and 600E) mic in yesterday's hamfest. It had a 6 pin plug (??) but I changed it over to the 4-pin TS-520 style. Will test it later today.

Oh yes, I also picked up an Astatic D104-M6. Will check that out too once the rig is up.

73,
de Aron VU2JMX.

Bert: Your in luck. Jefff WA8SAJ is just outside Cleveland and works on old rigs like yours. Jeff did an alliginment on my TS-530-S several years ago and it still works like new. When you pick your rig up, Jeff will have it on a scope and show you the best mic. gain setting (I bet it is between 9-10) for your rig and I promise you will be very impressed with the outcome. Jeff is first in first out so it will depend on his work load on how fast you will get the rig back. Do your self a favor and hand deliver it so you can view his set up. Check him out on QRZ for email, contact info, etc. Good luck, Rich K8UV

Subject: [TS-520_820_530_830] Re: TS 830s: Problem with VOX

Hello Fabio and Adrian,

I agree with Adrian, resistor R13 (100K) can easily prevent the sidetone from operating. Good job Adrian.

Be very careful when measuring voltages in the TS-830 with the power cable plugged into the wall. The Rectifier Unit PC board has very high voltages which can KILL YOU!! BE SAFE!!! Take your time, do not be in a hurry.

Unplug the TS-830 from the wall outlet, remove the covers, turn the TS-830 so the bottom is facing up and the front panel is facing you.

Locate the Rectifier Unit PC board which is to the "left" of the power transformer. Looking down at the Rectifier Unit PC board the "STB" pin is just forward of the relay and slightly to the left. Resistor R13 is mounted just forward of the relay.

Plug the TS-830 power cable into the wall outlet and turn the 830 on. Measure the voltage on the "STB" pin. If R13 is open or bad there will be very little or zero volts on the "STB" pin.

Again, be very careful measuring voltages on the Rectifier Unit PC board. There is high AC and DC voltages on this board!! BE SAFE!!.

Again, Adrian, good job!!

20087. AT-200 and AT-180 Antenna Tuners

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-02-08 15:15:21 UTC
From: vu2jmx
Topic: 20087 Message: 20087

Could someone please tell me the difference between an AT-200 and an AT-180 antenna tuners ??
Well, I do know for sure the AT-200 was for TS-520/820 series and AT-180 was for TS-180 series. After going through the schematics/manual of both, except for the different model numbers and a slight cosmetic change on the front panel (+ top/bottom covers are switched), I could not discern anything else.

Oh yes, the AT-200 is quite popular whereas the AT-180 is hard to come by.

Thanks & 73,
de Aron VU2JMX.

Dave,

VR1, sidetone volume control on the AF Unit, has no affect on the level of sidetone audio fed to diode D9 and ultimately to Q12. VR1 controls the level of sidetone audio fed to the receiver's audio amplifier Q4 and set the level of sidetone heard in the speaker and/or headphones, not the CW break-in circuit.

This might be a dumb idea, but how about trying a SMALL drop of crazy glue to your tuning tool and and GENTLY pulling the slug outwards while at the same time turning the slug CCW to either remove it or get it to re-engage the threads? Be careful to avoid letting the glue touch the inside of the form though.

good luck,
Greg

Hi there
Many thanks for your suggestion. Yes, I checked the electronic keyer and it does work properly. I tried also with straight key, but no way to let the VOX work. Thanks for help. It seems to be a bit more complicated unfortunately.

Hi Fabio,

You said you do not hear the CW sidetone in CW mode when pressing the CW key. This is good information as it tells me the CW sidetone oscillator in your TS-830 is not working which is why your TS-830 is not switching to transmit when you close the CW key in CW mode. This also tells me why the voltage at TP2 does not change from zero to .5VDC when the CW key is pressed. Now that we know what circuit is not working we can investigate further to find out why the circuit is not working.

I will get back with you tomorrow. I have some checking to do so until then, have a nice evening.

Hi Mike

First of all, let me resume the main problem, maybe I never mentioned it properly.

VOX is normally working in SSB, I mean, when I switch the vox control (gain and
delay) on the front panel of the ts 830s, it works correct.

When I want to transmit on CW, using the VOX with gain and delay from front panel, it does not switch into TX when I use the electronic paddle (Bencher-similar CW-Keyer). To transmit on CW I have to switch manually the switch in the front panel from REC to SEND. But, I don't hear the SIDETONE coming from the TS 830s (sorry, I didn't know until yesterday what is in english the
"sidetone".. . now I understood it, or at least I think to have it understood.. .), so in other words, on RX when I am keing the CW, I don't hear any tone in the "background" .

I did what you suggested here below in your email and the reults are the following:

I have been checking the voltage at TP2 of the AF unit: in RX the voltage is zero, if I go on TX (= I switch from REC to SEND and I send a tone from the CW
Keyer) TP2 remains at zero, so not going to 0.5 VDC on TP2. I have been checking
Diode D5 on the AF unit, but it seems to be OK. I have measured the Diode D5 without desoldering it from the AF Unit and it does seem to work properly.

Refering to your previous email (where you suggested to measure D9 at TP2... please apologize, but I just have read that email of you, after having reassembled the TS830s, so I didn¢t check it until now... I will most probably
do it tomorrow and then let you know if the Diode D9 is working properly or not. In any case, what seems to be for sure wrong, is that Voltage at TP2 while
Txing does not show 0.5 VDC, but zero.

I don¢t
know if you have any additional suggestion before I will measure if D9 is OK or
not. In any case, once more MNI MNI TNX for your great help and congratulations
to be very precise on describing where to find what in the AF units, I really
appreciated it a lot! I am not experienced at all on opening a transceiver, so
you can imagine, I am very careful, because I don¢t want to create more problems
instead of solving what is not working at the moment...

Mike,
Thanks so much for your great help, I wish you a nice weekend and hope to read

you soon. When I have additional information after after having measured D9 on
AF Unit, I will let you know.

Subject: Re: [TS-520_820_ 530_830] Re: TS 830s: Problem with VOX

Hello Fabio,

Since you said VOX is working in sideband mode but not CW, I suggested checking the voltage at TP2 on the AF Unit. If diode D5 is good, pressing the CW key in CW mode should cause the voltage at TP2 to change from zero to .5VDC. If diode D5 is open, the voltage at TP2 will not change when the CW key is pressed, it will remain at zero.. Diode D5 is a 35VDC 300ma switching diode. Any 35VDC 300ma or higher switching diode should work fine as a replacement.

If diode D5 is open you will still hear the CW sidetone in the speaker/headphones but the sidetone audio signal will not be rectified by diode D5 in order to control transistor Q12 and the
circuits after transistor Q12.

All of the above information is assuming diode D5 being open.

Fabio, will a straight key work using the VOX? If so, it could be
that the keyer doesn't key the higher voltage of the 830.. I had to
build a keying relay to make mine work. (The keyer output keys the
relay and the relay keys the 830) Then I bought a "Keyall" kit from
Jackson Harbor Press. http://home. att.net/~ jacksonharbor/ keyall.htm

Hello Fabio and Adrian,

I agree with Adrian, resistor R13 (100K) can easily prevent the sidetone from operating. Good job Adrian.

Be very careful when measuring voltages in the TS-830 with the power cable plugged into the wall. The Rectifier Unit PC board has very high voltages which can KILL YOU!! BE SAFE!!! Take your time, do not be in a hurry.

Unplug the TS-830 from the wall outlet, remove the covers, turn the TS-830 so the bottom is facing up and the front panel is facing you.

Locate the Rectifier Unit PC board which is to the "left" of the power transformer. Looking down at the Rectifier Unit PC board the "STB" pin is just forward of the relay and slightly to the left. Resistor R13 is mounted just forward of the relay.

Plug the TS-830 power cable into the wall outlet and turn the 830 on. Measure the voltage on the "STB" pin. If R13 is open or bad there will be very little or zero volts on the "STB" pin.

Again, be very careful measuring voltages on the Rectifier Unit PC board. There is high AC and DC voltages on this board!! BE SAFE!!.

Again, Adrian, good job!!

I did think of this, having used this technique in the past to remove cracked or stripped cores, but it is risky - you can glue the core into the former. In view of this, I didn't want to mention it in case it started another "zomg noob" storm ;-)

No Greg. It's not dumb.
I'll try it out. But before that I'll figure out how to separate the plastic tuning tool from the core AFTER pulling it out...

Aron.

Use a bit of scrap plastic rod or something. Chances are the core is ruined or the wrong one, so you're going to be throwing it away in any case.

The AT-200 does not have the WARC bands on the switch -- at least, the one I have doesn't have them. The AT-230 added the WARC bands.

He was mentioning he was hearing no sidetone, don't remember him saying the radio was not transmitting still. Maybe I missed that

Dave,

VR1, sidetone volume control on the AF Unit, has no affect on the level of sidetone audio fed to diode D9 and ultimately to Q12. VR1 controls the level of sidetone audio fed to the receiver's audio amplifier Q4 and set the level of sidetone heard in the speaker and/or headphones, not the CW break-in circuit.

Topic: 20087 Message: 20102

As best as I can tell -- cosmetic. The AT-200 has the chrome "ring" around it to match the '520, and the print on the face is a little different, though the functions all appear to be the same. I have the AT-200 so know that it doesn't have the WARC bands, but do not have an AT-180 and so am guessing from photos.

There may or may not be internal differences, though I believe they came out about the same time and would be willing to bet they are pretty much the same. OTOH, that wouldn't be the first bet I ever lost. Hi!

From: robin_joe2000
Topic: 20049 Message: 20104

Thanks to all for your helpful suggestions. My solution, for now, is to use RTTY so I can get Triple Play completed (just starting on it now). RTTY is much less frustrating due to the much wider bandwidth with little requirement for TX freq stability.

Once triple play is completed, I may investigate further. Seems like the most likely culprit is 9V instability. Or, just use my TS520 for what it does best, and save up for one of the nice 1ppm rigs.

I've used this process before and it worked more than it failed

try a hair dryer!

set it on hot and heat the coil form up.

this will expand the form ever so slightly allow you grab the slug.

Thans David.

Maybe there is a subtle difference in the inside construction/ component layout. I'll post some inside pics of my AT-180. You can then tell me the difference..

Aron.

20108. Re: TS 830s: Problem with VOX

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-02-08 19:46:50 UTC
From: kj4du
Topic: 20002 Message: 20108

Hi,
I had a very similar problem with my TS-830S several years ago where VOX would not work on CW. Problem was R61 on the audio board, this is a 2.2 megohm resistor but had drifted up to a much higher value. The resistor did not show any sign of physical damage. You need to disconnect one end of this resistor or temporarily cut the lead on one end to get an accurate reading with the ohm meter. Hope this helps.

--- Whoops! My Bad, do not know why but was thinking diff between 120
and the 130. I should have looked under the cover and it would have
bit me. Have not used it in awhile since I got my 920. That's what
happens when ya'll got four complete stations and only use two, plus
with the 101's sitting unpluged.
The only difference that I can see between the 180 and 200 is the
180 compliments the ts 180 series and the 200 was designed to
compliment the 520 and 820 series of radios (according to kenwood info.).

Harry

Why don't you email them to me. I will compare with the at-200 and, if there is an internal difference, I can take a photo and email it back to you.

It is with Great sadness that I have read of Bill's demise.

He was always helping new Boat Anchor owners with

The methods to keep these Cherished Radio's on-air.

Bill Preached Safety First when dealing with the main &

High Voltage within them. Like many in the Yahoo Groups

We were able to keep the working teaching us all to

Respect that he power can bight and be fatal if not respected.

Our Prayers and sincere thoughts for his family and friends

Both in Real life and on the net as well as the many contacts

He has made while on-air with operators all over the World.

Please pass along My Wife's Ruth's VK4HEY and my own

Bob VK4HAY regrets to his family from Down Under in

Australia

Regards Bob & Ruth

David, OM, many thanks for the pictures.

Yes, it is the size that is different between the two (ignoring the cosmetics).

Frankly, when I first opened the top cover I kept wondering why there was so much space between the porcelain former and the rear end. So, somebody in Trio, Japan realized that too, after the first lot rolled out of production. Hi Hi

I'm posting this on the group for others' benefit, of course minus the pictures.

Thanks and 73,

de Aron VU2JMX.

Perhaps you can offer the photos to anyone who would like to see the comparison. I think it is interesting -- if only from an equipment design evolution point of view.

I could also send the photos to anyone requesting.

David, OM, many thanks for the pictures.

Yes, it is the size that is different between the two (ignoring the cosmetics).

Frankly, when I first opened the top cover I kept wondering why there was so much space between the porcelain former and the rear end. So, somebody in Trio, Japan realized that too, after the first lot rolled out of production. Hi Hi

I'm posting this on the group for others' benefit, of course minus the pictures.

Thanks and 73,

de Aron VU2JMX.

FYI, I finally found it.

It was an old 3Com hub I got for nothing located in the basement
alongside a Cisco uBR router from my telecom company.
Sometimes "free" does not equal "good". A newer 3Com hub in the
shack exhibits the same problem, though not nearly to the same degree.

Time to replace it with something made in the last 10 years.

Thanks for all the suggestions.

Hi. It might not be the hub itself, itv may be the power supply. I
have a Belkin router, and it had a really noisy switching power
supply. I replaced it with a non-switching supply and the noise went
away.

Aparently noisy switching supplies are common with routers and hubs.

20119. AT-180, 200, 230 - VR1,2,3 trimpot resistance

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-02-09 06:31:27 UTC
From: vu2jmx
Topic: 20119 Message: 20119

David and anybody having an AT-180/ AT-230 Antenna tuner,

I need some help.

When you get a chance, could you please measure the resistance across VR1, VR2 and VR3 trimpot leads ??

AT-200 tripot values are different, whereas AT-180 and AT-230 are the same. (despite using a 300microamp meter in all the above models).

I could also use the readings of AT-200 as a benchmark - to start with. Anyways I'm groping in the dark. I'm convinced the previous owner/s has/have changed the factory settings of VR1,2 and 3 to operate at high power levels.

BTW, AT-230 is ditto AT-180 except for the WARC bands. Even the case is the same long one unlike AT-200's smaller case.

Thank you for your time.

73,
de Aron, VU2JMX.

20121. Re: TS 830s: Problem with VOX

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-02-09 13:16:23 UTC
From: w5rkl
Topic: 20002 Message: 20121

Hi Tex,

R61 is part of the VOX gain circuit and, in sideband, it would defanately have an affect on VOX operation. However, in TUNE, CW-W, and CW-N modes, the VOX gain circuit is not used and is turned off by the mode switch. In CW mode the sidetone oscillator signal bypasses the VOX gain circuit and is fed to diode D9 where it is rectified into an ON and OFF DC voltage that is further fed through R60 to Q12. Q12 is part of the VOX relay and delay circuit that controls activation of relay RL1 and how long RL1 remains activated.

Having said that, Fabio's problem now appears to be a non-functioning CW sidetone oscillator and not a VOX problem. Without a sidetone oscillator signal fed to diode D9 on the AF unit, CW break-in will not work.

Topic: 20002 Message: 20123

Hello Mike and Adrian
So, Yesterday I could at least take the time to measure D9 on the AF Unit. Well, D9 works properly. OK, next I will check R13 in the rectifier unit.
Adrian: as you mentioned, in your mail, it's not enough to just measure it, cause it could "look" OK but not working properly. So, let me ask, at best I just replace it. OK?
Mike: I am happy to see that you and Adrian agree about R13 and many thanks about the safety tips you gave me. As UNEXPIERENCED it's good to know that I have to be very careful. In order to avoid any HV risks, is it enough that I unplug the 230 VAC cable and wait for a minutes before "touching" without risks any part of the rectifier unit or do I have to pay attention even if no 230 VAC is connected?
I bit shame from me to ask about this very basic things... hope not too many people will read this.....
It will probably takle a few days before I can replace the resistor, since I have no spare parts, I have to find them first.
Wishing you all a nice day and week and MNI TNX for GREAT help!

Subject: [TS-520_820_530_830] Re: TS 830s: Problem with VOX

Hello Fabio and Adrian,

I agree with Adrian, resistor R13 (100K) can easily prevent the sidetone from operating. Good job Adrian.

Be very careful when measuring voltages in the TS-830 with the power cable plugged into the wall. The Rectifier Unit PC board has very high voltages which can KILL YOU!! BE SAFE!!! Take your time, do not be in a hurry.

Unplug the TS-830 from the wall outlet, remove the covers, turn the TS-830 so the bottom is facing up and the front panel is facing you.

Locate the Rectifier Unit PC board which is to the "left" of the power transformer. Looking down at the Rectifier Unit PC board the "STB" pin is just forward of the relay and slightly to the left. Resistor R13 is mounted just forward of the relay.

Plug the TS-830 power cable into the wall outlet and turn the 830 on. Measure the voltage on the "STB" pin. If R13 is open or bad there will be very little or zero volts on the "STB" pin.

Again, be very careful measuring voltages on the Rectifier Unit PC board. There is high AC and DC voltages on this board!! BE SAFE!!.

Again, Adrian, good job!!

Hi Fabio,

Well if the STB voltage is somewhere around 100 volts then R13 is definitely okay and we need to look elsewhere for the problem.

Good luck,

Adrian / ZS1TTZ

Hello Fabio,

Just be careful when measuring voltages on the Rectifier Unit and anywhere in the TS-830. Do not touch the connections with your fingers or allow you hands, arms, or any metal ring, necklace or other jewelry to come in contact with any circuit when measuring voltage. BE SAFE and you will do fine.

Do not replace R13 until you are sure there is no voltage on the "STB" pin. The TS-830 must be turned ON to measure the voltage on the Rectifier Unit PC board STB pin. The TS-830 does not have to be in transmit.

I'm looking for the control knobs for the load and meter switches for a TS-520. Same as the load and fixed channel for a TS-520S. Had to cut mine off and now need replacements.
Thanks Ron/W5RCP

Hello to the group, I have just recently purchased the TS-520s and just joined new to the group. I have been interested in these older rigs for quite some time, having at times owned the older tube types including the yaesu 101B.

I do have the question about wireing the mc60 to the radio or maybe a better question is what is a good Mic to fit the TS-520s it came without the mic cause it had been used for cw by the previous owner.

It has a super receive and the radio is real clean.

Thanks in advance for your comments

From: jimmyz2k
Topic: 20131 Message: 20131

I have owned this ts520se for about 3 years now.This group has helped me through quite a bit.Just a question for those familiar with this rig.When you select the 1.8 mhz band,what is the usable frequency bandwidth on the receiver side?Mine seems to become useless after about 2.1(mhz).Is this normal?Besides my meter does not read properly since I have owned this rig.How exactly does the JJY WWV selection work?I get nothing.Otherwise,this radio has been good to me.Noticed some poor soldering on a transformer,it caused some audio/RX issues.Moving the wires clearly acted to be a problem.I re soldered these 4 wires and the RX is terrific.All 4 of these wires were together on one transformer terminal.

Welcome to the group. I'm new to the group too, even though this is my second classic TS-520 after a gap of nearly 15 years. Sold my first rig because I found it difficult to move it around in my travelling job.

I've recently tried the Astatic D104M6 and a YD-148 with good results. Nothing like a matching classic MC-50 if you can find one.
Why spend extra on the MC-60, unless you already have one.

There's some interesting info on a MC-60 here
http://groups.yahoo.com/group/KenwoodMics/message/293

I understand there was an error in the original wiring. Here's the pin out of MC-60.
http://homepage.ntlworld.com/rg4wpw/mc602.html

Maybe the others on this group can give you more info.

73,
Aron.

At the risk of attracting "QRO CBer" comments from the peanut gallery, I find the MC-10 handheld mike perfectly okay. I don't have a lot of clear desk space in the shack, so a desk mike is less suitable for me. Just about any high-impedance mike will do. You could use a low-impedance one with a matching transformer or a simple preamp.

What kind of mike you use doesn't matter. How you use it does. If you can have a QSO with someone that you know ("wait, you mean you don't sound like a frog in a tin bucket in real life?"), and find the best speaking distance and mike gain settings, then that will help your transmitted audio far more than any amount of expensive toys.

There seems to be a fashion for using relatively inexpensive "studio" mikes for HF. They're okay, but you don't need anything that complicated.

> It has a super receive and the radio is real clean.

They sound great, don't they? An external speaker makes a huge difference, though - the little 3" speaker screwed to the metal lid isn't ideal. I drastically improved the rather tinny and naff sound quality from my TS520 by, uhm, moving the ATU so it wasn't blocking the internal speaker's grill... Like I said, space is a little tight in the shack at MM3YEQ ;-)

Hi Michael. You have a good radio there. Unless you already have an MC-60, I would go with the MC-50. Some folks that I have talked to think that they are a little pricey, but the MC-50 is definitely worth it.

What I have found with the Kenwood TS-X20 and TS-X30 series radios over the years, is that any decent mic will sound good. How you talk into the mic, and room acoustics do have an effect on how you sound. I have an article written by NF5B, a good friend and a professional musician who does his own recording and production. If anyone is interested, I can post it to the files area.

Greetings to the Group,

I have enjoyed reading the posts on this Group for the last few weeks. The knowledge and willingness to share information and assistance is very impressive. I just purchased a Kenwood TS 830S Gold Edition with an SP-230 speaker which I pick-up on Thursday. This is my first venture into owning an operating a Hybrid transceiver. I look forward to learning to operate and enjoying the rig. I think it's going to move my FT-897D to back-up status. I look forward to continuing to read and learn from the posts of other owners of the TS 830S.
Thank you for having such a great resource for owners of Kenwood Hybrid Transceivers!

From: w5rkl
Topic: 20129 Message: 20137

When it comes to microphones, impedance matching is very
important. A low impedance microphone can result in low audio output
from the speech amplifier. Low audio output from the speech amplifier
will also result in low final amplifier output. Turning up the MIC
gain to compensate for a microphone impedance mismatch and low final
amplifier output can lead to distortion in the speech amplifier's
output that can easily produce splatter to adjacent frequencies.

The MC-50 is a good microphone since it matches the 520s microphone
impedance.

I really appreciate all the comments I received on the TS-520S. I can see now I'm in the market to get an MC-50 microphone, I didnt want to rewire my MC-60 for it cause that one is wired for my TS-2000. If somebody has one for sell at a good price, I maybe interested if not then I may go to ebay.

Thanks

If you can find them on ebay or where ever, Kenwood had adapters available
for 8 pin to 4 pin. I find even making one up is best

Look around for a mj-84 kenwood adapter..

I have a couple of those adapters but prefer to build an interface cable to reduce stress on the rig's connector. Now I only use the adapters in the shop.

Great radio! I have owned three of them. One that I bought from eBay was heavily modified and the mods were done badly, so it became parts for the other two. I have gotten lots of comments about my signal and have been asked several times if I am running an amp, which I am not. Great receiver as well.

Learn all you can and follow good tuning practices and maintenance and this radio will last 30 years or more.

I have a TS-520SE with the paddle for the Standby switch (Send/Rec) broken. The switch works if you poke something in to move it, but I would like to fix it. I believe the "paddle" front of the switch is generic to many Kenwoods, and not an actual part of the switch. Anyone have one they will part with?

20152. TS-520 and TS-820 Drift fix

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-02-11 19:14:23 UTC
From: w5rkl
Topic: 20152 Message: 20152

I have been experiencing drift in my TS-820, a lot more than it should have. Replacing the 14VDC filter caps, two 2200ufd 25VDC on the relay board, helped some but the 820 still drifted more than I cared for.

Monitoring the 14VDC supply showed the 14VDC supply was very stable but the 9VDC was another story, as much as .95VDC increase was noted over a 30 minute period. This resulted in a significant drift in the 820. This instability in the 9VDC supply also affects the receiver's 3.3VDC bias supply as well.

I traced the instability in the 9VDC supply to D5 on the 820's AF-AVR Unit. Replaced D5 with a 1N5234B, 6.2VDC 500ma 1/2 watt zener, and monitored the 9VDC supply for 30 minutes. The 9VDC supply showed a maximum increase in voltage of .01VDC, a drastic improvement from the .95VDC prior to replacing D5.

The TS-520 uses the same 9VDC regulator circuit. The diode is "D3" in the 520 and is located on the FIX CH AVR Unit. I have not checked the 520S or the 520SE but I would suspect it's the same on both models. Check the model's schematic to be sure.

The schematics for both units are readily available online.

The VCO assembly is the same for both units. The control and LED assemblies are different part numbers but the schematics look to be the same. The VFO-820 has a single dial light; the VFO-520 has two. The 9 pin connector appears to be wired identically.

Looks like it'd work to me.

Hi Joe,

Yes, it appears the drift has been fixed. I may end up replacing Q7, a 2SA496 (Y) which I initially considered replacing along with D5.

The 820 needs some additional work. I found the Rectifier Unit's 210 AC source is not connected to the right transformer terminal, it is connected to the AC300 transformer terminal. I have no idea why this was done. I don't remember a technical bulletin covering this. I'm not the original owner of this 820, I bought it on eBay about 8 years ago and I'm slowly finding and fixing problems it has. It needs a complete alignment which will be the last step.

20157. Update on Microphone

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-02-12 06:05:02 UTC
From: Michael
Topic: 20157 Message: 20157

To the group, An update on the Microphone. I decided to go ahead and wire my MC-60 up to the Kenwood TS-520S and Dang, Man talking about Kenwood Audio, It sounds as though the MC-60 is a perfect impedence match to the radio. My TS-2000 comes back from the shop on thursday the 13th but I'm going to keep this Rig on the desk for a couple of days, I'm almost camparing the receive and transmit to that of the TS-2000, it sounds that good, but just not quite. Can't go that far.

Thanks for all the replies.

20158. TS 830s: Problem with VOX SOLVED!

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-02-12 09:19:36 UTC
From: Fabio Scherrer
Topic: 20158 Message: 20158

Hello Mike, hello Adrian and to all who wanted to help me!
I am very hapy to announce that the problem with VOX has been solved! Congratulations and thanks soooo much to Mike and Adrian: you were right, the problem was at Resistor R13 in the rectifier unit (at STB the Voltage was almost zero, after replacing back to the correct 108 VDC). Even if no signs of stress or damages, the resistor was no more working correct. It is been easy job to replace it and, Mike, thanks again for caution information about safety with high voltages in the unit. I did the job by a very experienced friend of mine (HB9CXZ) and he shown me where to take care and where discharge the capacitors in order to work without risks.
At the moment the TS830s is working absolutely properly. Tomorrow I will receive a YG-455C CW Filter and, together with YK-88C

It should do a good job. Another thing I will "improve" is to connect a 2nd receiver in order to be able to work on split, because I have no External VFO such the VFO-230. K5D, Desecheo, should start their activity soon, I cannot expect to work them with the just 2 KHz RIT/XIT ... I guess they will work with huge splits, so a second receiver is absolutely needed to have a chance with them.

Once more, let me thank very much all who tried to help me solve the VOX problem. I have been really surprised, after posting my problem, about how many of you wanted to help me! Just great!

Mike: did you get my "private" mail a few days ago?

Wishing to everybody a very nice day,
Best 73's from Switzerland, HB9FAP, Fabio

Subject: [TS-520_820_530_830] Re: TS 830s: Problem with VOX

Hello Fabio and Adrian,

I agree with Adrian, resistor R13 (100K) can easily prevent the
sidetone from operating. Good job Adrian.

Be very careful when measuring voltages in the TS-830 with the power
cable plugged into the wall. The Rectifier Unit PC board has very high
voltages which can KILL YOU!! BE SAFE!!! Take your time, do not be in
a hurry.

Unplug the TS-830 from the wall outlet, remove the covers, turn the
TS-830 so the bottom is facing up and the front panel is facing you.

Locate the Rectifier Unit PC board which is to the "left" of the power transformer. Looking down at the Rectifier Unit PC board the "STB" pin is just forward of the relay and slightly to the left. Resistor R13 is mounted just forward of the relay.

Plug the TS-830 power cable into the wall outlet and turn the 830 on. Measure the voltage on the "STB" pin. If R13 is open or bad there will be very little or zero volts on the "STB" pin.

Again, be very careful measuring voltages on the Rectifier Unit PC board. There is high AC and DC voltages on this board!! BE SAFE!!.

Again, Adrian, good job!!

The TS-820 has a built in 120/240VAC power supply.

Did you receive the power cable that plugs into the rear?

Cleaning a TS-820S requires more than just using canned air. The
different switches and potentiometers need cleaning with contact
cleaner and non-abrasive cleaner for the cabinets, knobs, and front
panel and some of the cleaners you will needs.

If you have never cleaned and/or repaired a piece of ham gear before,
may I recommend you find a local ham to help you. This is especially
true with the TS-820S since it is quite easy to damage the radio
during cleaning if you are not careful.

Hello Fabio,

That is great, I'm really glad to hear the 830 is fixed.

A note to Adrian, good job pointing out the resistor in the Rectifier Unit. It was clear that resistor prevented the sidetone oscillator from working. Resistor can "look" good. As the ole saying goes, "looks can be deceiving".

Fabio, the last e-mail I received from you was dated February 7 which also was directed to the forum. In that e-mail, you described your problem in detail. I have not received any e-mails after that one.

Again, congratulations on fixing your 830.

Hi All,

I have a TS-820, and just ordered an AT-250 auto antenna tuner.

Does anyone have experience with utilizing this tuner with my rig, and can they advise me as to how to configure, or put it to work?

Thanks in advance!

Jeff, KB3QMT

Unfortunately the TS-820 is not "directly" compatible with the AT-250
and the 820 cannot "automatically" control the AT-250.

First things first, is the heater switch on? Have you left it long
enough for the valves to warm up? What does the HT voltage read when
you switch to transmit?

Gordon

I am getting a spare set of tubes (6146 & 12by7a) for my TS-520S. I have found the Sylvania 6146W tubes (matched set) which should go right in, But the 12by7a Driver tube is a GE, Has anybody had any trouble out of the GE driver. I wanted the driver to be a sylvania also, but no luck yet finding one.

Thanks
Mike

Kenwood AT250

--- KD6LOM Rating: 5/5 Jul 4, 2008 15:02 Send this review
to a friend
AT-250 CAN BE USED WITH ANY TRANCEIVER: DO THIS MOD Time owned: more
than 12 months
This anto tuner was designed to work ONLY with the Kenwood TS-430 as a
"AUTO" tuner.(automatically selecting the band to be tuned) With the
proper cable to interface the TS-430 and the AT-250 the band to be
selected was done automatically, if the band selection on the tuner
was set to AUTO>

HOWEVER: the auto band selection function will ONLY work with the
TS-430, NOT with ANY OTHER TRANCEIVER

If used with any other tranceiver/transmitter You must MANUALLY select
the band on the tuner to be tuned. IN addition: a slight mod must be
done to allow the tuner to properly engage the tuner to tune. If not
done, the tuner will not properly tune and the power tune lights will
not give a proper indication.

MOD TO ALLOW USE OF TUNER WITH OTHER THEN KENWOOD TS-430:

Simply take off the top cover and place a JUMPER wire from pin 3 of
the interface plug to ground. this gives a gound to the PTT the tuner
needs to allow the tuner to operate properly. You do NOT need a cable
to give a PTT ground to the tuner. This will allow it to be used with
any transmitter.

Remember keep your tuning power to under 20 watts, while tuning.

I see numerous tuners up for sale, stating the tuner will not tune,
this is because they are trying to use the tuner in the AUTO mode with
out the use of the cable connected to a TS-430 or are trying to use it
on a generic tranceiver and have not grounded pin 3 on the interface
plug of the tuner.

AFTER MOD IS DONE HERE IS THE WAY TO USE THE TUNER WITH OTHER THEN A
KENWOOD TS-430
1) PUSH ON MAIN POWER BUTTON, you will see a green power light,

2) PUSH ON THE "TUNER" button on the lower left corner. You will see a
green light come on.

3) Select band you want to tune

4) Place meter switch to RF power, TX your RF into the tuner and set
for under 20 watts. NO more!

5) Then PUSH ON the "TUNE" button on the upper right corner.

6) Switch the meter to the SWR position.

7) Then TX into the tuner, You will see a RED light come on under the
TUNE button and here the motor tuning. It should stop within 15
seconds and lock the tuner. SWR will be indicated on the meter.

8) Turn OFF the TUNE button on the upper right corner of the unit.

That's all there is to it! very simple after you have done it a few times.

Hope this helps all out there.

73's KD6LOM

NOTE ON MY COMMENTS: The indicator lights are small 12 volt bulbs and
one LED , I have found several units with burt out bulbs. The lights
failing to come on, if burnt out will NOT effect the tuner from tuning
if you do the MOD I have documented. Just replace the bulbs when you
can with a like bulb or a LED

What are you using for a load and a wattmeter? Do you have a dummy load? Oe thing that I would look for is a intermittant coax.

Next, what does the meter read when in the HV position ?

Remember that to get a reading on SSB the mike gain must be turned up and there must be audio applied to the mike. Is the mike working ?

To get full output on CW the carrier control must be fully up.

On SSB with no audio applied are you able to adjust the idle current to 60 ma?

If you paid extra for the matched set, there was no need to. No advantage in a parallel AB amplifier.

The 12BY7A is a dirt grade dual triode that was originally designed for wideband amplifier use in television sets. There's certainly no advantage to picking Sylvania over GE in this (or any) application that I can think of.

My 820S has a GE driver and 2 Chinese 6146B's. Works great!

Gang

I have a sleeve of five (5) GE 6146W's manufactured in 1987. They are NOS in their original boxes and excess to my needs.

$18.00 a piece or $90.00 for all five. I guarantee them unconditionally and if you are not happy with them for any reason return them to me within 7 days of receipt and I will refund the purchase price less cost of shipping.

Shipping via USPS Priority mail with Delivery Confirmation. Shipping costs below:

one tube - $6.25
two tubes - $7.45
three or
more tubes - $8.60

Payment to my PayPal account - k3hw@...

Payment received TODAY before 2:00 PM ships TODAY. Payment received TODAY after 3:00 PM ships Saturday morning 2/14/09.

Tnx es 73 de Howard K3HW

I agree, spending extra money for matched tube sets for parallel amplifiers is a waste of money. If the amplifier operates in "push-pull" then yes, matched tubes are important.

Al, I'm not sure what you mean by "dirt grade dual triode" when referring to a 12BY7. The 12BY7 is a pentode not a dual triode.

Al,

Been there done that so many times I can't count..

Right now I'm trying to figure out why a previous owner of the 820S I have added a 120K 2 watt resistor in series with the bias pot, installed a 1K 1 watt resistor in series with the SG final connection and the SG switch, and wired the Rectifier Unit's 210 connection from the power transformers 230 tap to the 300 tap. The screen voltage will increase on the driver tube which will produce a high RF driving signal to the final amplifier, that I know. If it was done to achieve higher output power that was a bad thing to do in my opinion. But the series resistor with the bias pot and the series resistor in the SG final stage to the SG switch, I have no clue why they did this. I have some looking to do that's for sure.

There's always something to do with vintage ham gear. That's whats owning them so much fun!!

Thanks for the reply, Walt.

I'm using a Yaesu FC-901 antenna tuner. It has a watt and SWR meter. I have both a dummy load and my G5RV Jr attached.

If I remember from when I check last night, the HV reads about 850.

Yesterday I had the mic gain turned up all the way and I tried a CQ on 10m. The watt meter barely came off the peg. Now this was probably 10 or so minutes after having the heater on. I turned the rig on just now and after letting it warm up for 1-2 min I can get almost 100 W of output read form the tunder, but it seems like the reading dies off towards the end of my CQ.

The mic just came out of storage as well. I haven't done any testing on it, nor am I sure of the correct way to do so.

On USB and the meter set to IP, the current shows just below 50mA, the same place I had adjusted to yesterday.

Since it sounds like the preious owner(s) increased the B+ supply,
maybe they had to add those parts to be able to bring the bias into
spec?

That's assuming, of course, that there was a rational explanation to
begin with.

Isn't the bias supposed to be set to 60ma?

That's what the manual says. It also said that greater than 60mA can shorten the lift of the tubes. I set mine just shy of 60mA, like 55mA, in the hopes of not breaking something while setting up this unfamiliar rig.

Don't forget that as you reduce the bias, the final amplifier is conducting over less of the input cycle and thus reducing output power, all other things equal. With CW, you can overcome this by increasing the carrier control. In SSB modes, the level is limited by the dynamic range of the mixer.

Okay. I adjusted the bias so the IP is exactly 60mA now.

I think I might actually be getting somewhere now. Before I couldn't get the ALC to read anything on the meter. For some reason today I could get through the drive tuning procedure with no problem.

Now I'm at 50W if I speak quite loudly into the mic.

I'm not sure if this has been mentioned but have you cleaned the
contacts on all of the switches (band switch, modes switch, function
switch etc) with contact cleaner?

I also recommend checking the voltages on the AF-AVR board. Age can
cause these voltages to change.

The AF-AVR board is located on the bottom of the 820 directly below
the VFO. To measure the 3.3VDC and 9VDC, remove the covers, turn the
820 upside down with the front panel facing you. The AF-AVR board is
the small PC board in the middle next to the front panel. Along the
front of the board are two plugs. The plug on the left is AF1 and the
plug on the right is AF2. Pins are numbered right to left on each
plug, 1, 2, 3, etc. AF1 pin 1 should measure 9VDC. If it does not,
adjust VR4 located in the middle of the board so pin 1 on AF1 is 9VDC.
AF2 pin 6 should measure 3.3VDC. If it does not, adjust VR1 so pin 6
on AF2 measures 3.3VDC. VR1 is located between plugs AF1 and AF2.

20190. TS-820 drift

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-02-14 00:27:08 UTC
From: w5rkl
Topic: 20190 Message: 20190

My last post stating my 820 drift was fixed. Well, after further monitoring, it became clear that not only D5 needed to be replaced but Q7 (2SA496-Y) also needed to be replaced as the drift, although a lot less than it was before replacing D5, the drift was still a bit too much.

I replaced Q7 with a new 2SA496-Y and set the voltages to 8.99VDC and 3.31VDC on the AF-AVR board.

I continued to monitor the drift over a 2 day period. So far, the 820 is well within the factory specifications after replacing both D5 and Q7. The factory specs pertaining to drift in the 820/820S is 100Hz "after" a 30 minute warm up period.

The 820 will drift very slowly during warm up. However, after warm up, with new D5 and Q7 components, the drift is well within the factory specs.

Hi Jim. The TS-430S is a good older Kenwood radio, but it is all
solid state, not a hybrid. This is not the right group. Most of the
problems people have had with the TS-430S have been well documented.
I think there may be a Yahoo group dedicated the the TS-430S, but I am
not sure.

Feel free to email me direct, as I used to own a TS-430S myself.

I see in one of ur posts, you started xmiting after 1 or 2 minutes of warm up....after your rig being unused for such a long time, NOT providing a LONG burn-off time for the gasses in the tubes will seriosly harm them...You should have considered letting the tubes warm up FOR 1 or 2 HOURS....at the very least...to allow the 'getter' to absorb the gas that has leaked into the tube over the years...some folks recommend they warm for DAYS, before reusing an old gassy tube.

20197. TS-820S Problem

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-02-14 06:42:12 UTC
From: f5ul01
Topic: 20197 Message: 20197

Hello the list!
First off, I'm a ham from France (F5UL). I'm reconditioning a TS-820S that was very badly modified for CB (11 m band!).

I have a lot of problems, tied to the components. I put it back on the original bands (VCO and PD boards) relatively easy, and now I think I have a nice receiver, as the results on all bands seems to par with my Elecraft K2.

But the Tx side is bad.

The ban switch in the PA cage was changed for someting that may have worked on 27 Mhz, but is out of use for the other bands (at least 160, 80, 40 m) where it is impossible to tune and load the PA.

There is only 2 wafers on the switch (insteed of 3) and I found upon examination that the wafer S4-2 and S4-4 where missing and there was no additives cap in parallel with VC1 and VC2. By the way VC2 has all 3 cage wireds in //.

Can somebody help me with a spare PA band switch part complete with 3 wafer, or if only the 3 separates wafers are disponibles, they will do!

When this part of the problem is solved, I will see what I still have to repair and inform you of the results.

Best 73 to all and thank you in advance!

Bob/F5UL

20198. Frequency Display jumping

Yahoo group: TS-520_820_530_830 (2009)

Topic: 20198 Message: 20198

I have done everything noted below and so far I have not located the problem that is cousing this. Is there any thing else that I can do or check for this problem.
Thanks and 73s
N5PEF

In addition to Gordon's suggestion I also recommend checking and, if necessary, adjust the two AF UNIT pots for the following voltages:

1. The voltage at TP-6 should measure 9VDC. If it does not, adjust VR4 on the AF UNIT so the voltage at TP-6 is 9VDC.

2. The voltage a plug 9 pin 5 should measure 3.6VDC. If it does not, adjust VR3 on the AF UNIT so the voltage at plug 9 pin 5 is 3.6VDC.

The AF UNIT board is located on the bottom of the 830. With the bottom cover removed and the 830 upside down and the front panel facing you, the AF UNIT board is on the left closest to the front panel. There are two plugs on the rear of the board. Plug 9 is the plug on the right. Pin numbers run left to right, 1, 2, 3, etc. Plug 9 will be labeled "RF1". The 3.6VDC voltage adjust pot, VR3, is located just forward of plug 9/RF1.

TP6 is located on the left front of the AF UNIT. The 9VDC voltage adjust pot, VR4, is the "left" pot between TP6 and the front panel. The pot just to the right of VR4 is VR1, the sidetone pot.

The 830 should be in receive when measuring and, if necessary, adjusting the two pots on the AF UNIT for the corresponding correct voltages.

You might Check the connectors on the Display board for bad/dirty pins
and broken wires one at a time.
I just had a TS-830S here that the display was acting strange and
jumping around. I discovered a wire that looked good but was broken
inside the insulation right at the connector.
Also be sure to check the connectors at the very front of the IF board.

Hope some of this helps.
73,
Gordon

Hi George. DeOxit D5 is available from Antique Electronic Supply. I think that they have a minimum order.

Good Luck!

It also is available from some On-Line sources.
I usually buy two cans at a time and the savings from buying it on-line
actually covers the shipping costs.

I am selling a nice TS-830S.
It is in very good cosmetic condition. I have just finished a complete cleaning and alignment. It works good.
It is the GOLD version but does NOT have any optional Filters.
Price is $400.00 plus 45.00 for shipping here in the continental USA.
I have put this radio on the air and have received great audio reports.
Please email me direct if interested.
10 day money back Guarantee (minus shipping)

Pretty much any 1A 800v diode, by the looks of it. Don't worry if the diode has a higher voltage or current rating, just use what you have that has at least that spec.

I'd use 1N4006 or 1N4007 there. Well, actually I'd use 1N5407, because I've got masses of them. No point ordering stuff in if I don't need to.

20216. Re: TS-820S Rectifier Board

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-02-15 14:30:33 UTC
From: w5rkl
Topic: 20207 Message: 20216

Diodes D8-D11 are "V06B" silicon diodes rated at 100VDC at 35ma. Therefore, any silicon diodes rated at 100VDC at 35ma or higher can be used as a substitute. A 1N4002 will do fine as a replacement. The 1N4007 or 1N5407, if that's all you have, will also work as a replacement for diodes D8-D11. Diodes D8-D11 are the 14VDC bridge rectifier diodes.

The 14VDC supply not only powers the relay on the Relay board and all circuits requiring 14VDC (pin connection labeled "14" on numerous PC boards), but it also provides the source voltage for the 3.3VDC receiver AGC bias, the main 9VDC voltage for ALL of the PC boards, and if your 820 is equipped with the DG-1 digital display unit, the source voltage for the 5VDC DG-1 regulator circuit. Therefore, a failure in the 14VDC supply will affect quite a lot of circuits in the 820.

Hello Joe,

If the Rectifier Unit's foil runs appear to be overheated, that can be caused by two things, 1) excessive heat from a high wattage solider pencil or, 2) high current demand placed on the power supply. If the solder appears to be in a "ball" or dull colored, that would indicated a "cold solder" connection.

What do you mean when you say your 820 is "quite handcapped"? Was it modified to Chicken Band (11 meters) like many CB hack shops do? What condition is the front panel, knobs, top and bottom cabinet sections, rear panel, and inside? If your 820 has not been modified for Chicken Band, the items I listed are in good shape, no broken knobs and all knobs are original, but electrically your 820 is not working right, the 820 can be fixed! It will take some time and, yes, money, to get it back to its original operating condition.

All this depends on whether you really want to keep your 820 or not.

What is an accepted substitute for the 4 diodes (D8-D11) on the rectifier board. I had one bad diode and might as well replace all 4.

Thanks Joe k7mks_

I do a lot of repairs on synthesizers (of the musical rather than RF variety), and probably the most common failure (after scratchy contacts in plugs, switches and pots) is blown rectifier diodes. These often fail dead short, releasing vast amounts of magic smoke. Quite often this cooks up the traces on the board too - I've seen the trace heat up and buckle enough to short out to the earthed foil lining on one Roland JX-8P, with hilarious consequences.

Check and replace the diodes, then test very carefully. Work your way through the rest of the power supply and make sure nothing else is getting hot and bothered. If one diode in the bridge has failed, do the lot - the others won't be far behind.

Gordon

I use the pico-keyer offered by N0XAS:

http://www.hamgadgets.com/product_info.php?cPath=21&products_id=89

It has a lot of features for the price, is small enough to mount
inside your rig if you choose, and has no problem w/ grid-block keying.

Topic: 20221 Message: 20225

Unplug the microphone, place the mode switch in USB or LSB, turn the MIC gain setting to 2 or 3 o'clock, set the meter to "RF", connect a dummy load to the 820, then flip SEND switch up (places the 820 in transmit). While watching the 820 meter, press your thumb firmly across the microphone socket. Do you see meter movement with your thumb pressed against the microphone pins? If so then it's quite possible your problem is the microphone and not the 820.

There's no danger nor will you receive a shock when pressing your thumb against the 820's microphone socket. Don't forget to turn the MIC gain setting back to 9 or 10 o'clock.

Next thing to do is clean the MODE, BAND SWITCH, and FUNCTION switches with contact cleaner. Do soak the switch, a little goes a long way. Use canned air, those air cans used to blow dust and dirt out of computer keyboards etc. Walmart sells them for $5.95 a piece, to remove the excess contact cleaner. Wait 3 to 5 minutes before applying power. Contact cleaner is "flammable" and it only takes a slight spark to ignite it.

What microphone are you using? The 820 has a high impedance microphone input. An MC-50, MC-60, Shure 444, non-amplified D-104, and a number of other high impedance microphone will work with the 820. You might try another microphone, if you have one. Make sure you wire the microphone to the 4 pin plug as outlined in the 820 manual.

A couple of additional things to check.

Place the 820 in sideband (USB or LSB), connect 820 to dummy load, plug in the microphone, meter set to IP and press the PTT button. The meter should indicate 60ma. If it does not, either higher or lower, adjust the bias pot on the lower right rear of the 820 for 60ma on the meter.

Another thing is to check the HV. Place the meter switch to HV. mode to USB or LSB, and press the PTT button. Read the HV on the orange colored scale, 0 to 10 x 100. It should point at or above the number "8" (800VDC).

Hi Mike,

I think you meant to say do not soak the switch.

I note that some people tend to use the "whole can" of contact cleaner or Deoxit when working on a set. The extra spray might help to flush out any contaminants but will do little fix the problem. We should remember that all the fluid that drips off the switch or contact has done nothing to repair the problem. In particular, the instructions on the Deoxit can advise that it is used sparingly.

Mike: Thanks to you and others for your replies.

I plan to repair the rectifier board and then measure the current between the board's14V outlet and the circuitry in the 820. Will compare that with the same test in my good 820S with controls set in the same position. If currents are close to each other then the rectifier board was at fault. If not then it will be necessary to see which component/board down the line is the culprit.

The cabinet has rust and needs to be stripped and repainted. There is metal discoloration/oxidation in many spots of the internal plug in units. If the rectifier board repair corrects the pro blems then it can be used as a loaner to a new ham.

Otherwise it may give its life to help others who needs parts.

Check it out internally for signs of corrosion too! You never know what havoc it may have wrought on the insides. Some of the boards are earthed to the chassis by their mounting screws, so it might repay you to whip those out and give it all a wee brush up underneath.

Of course the plus side of stripping and repainting it is that you can have a custom paint scheme to match the rest of your shack...

Joe,

My first suspect in the 14 volt supply, if excessive current is found to exist on the 14 volt supply, would be the two 2200ufd 25VDC filter capacitors on the relay board. If one or both of these capacitors short internally one or a short to ground on the board exist in the 14 volt supply, one or more of the diodes, D8 - D11, will fail.

When replacing D8 - D11, make sure the diode's banded end lead is installed correctly. Failure to ensure this is right will lead to some interesting symptoms and additional problems/failures.

20236. TS-820S - no transmit

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-02-16 01:59:16 UTC
From: chris_yipyap_com
Topic: 20236 Message: 20236

After two years on the shelf I dug into the TS-820 again this weekend.

I'm still as stumped as I was two years ago.

On the RF board, I have signals coming into the transmit mixer FETs, I peaked T1 and I have lots of input signal. But the DC is still -5.8V, so nothing comes out the other side of the mixer. Everything around Q4 reads -5.8V, no changes between transmit and receive. Over near Q2 on the receive side of the circuit the voltage readings look fine with the appropriate difference between transmit and receive.

I've been scratching my head but I can't find where the problem is. Somehow the T/R switching is not working and it looks like Q4 is the center of the trouble but I can't figure out how it is supposed to work or what might be wrong. With the base always being negative relative to the emitter, I don't see how it ever conducts.

I did take the faceplate off, tightened the headphone jack (being loose was causing my meter to act goofy since is serves as ground for the meter). I sprayed contact cleaner in every control, exercised them, cleaned the face up a bit and put it all back together.

I think I remember this problem when you were dealing with it 2 years ago and frankly, it stumped the band.

Go to n6wk.com and download the high resolution TS-820 service manual that he has there. Unlike other diagrams available the resolution is so good that you can expand it to 400% and accurately read the voltages.

http://www.n6wk.com/kenwood/TS820_SvcManHighRes.pdf

All 4 gates should read about + 2.5 volts when driven with RF from the associated coil. What I think is supposed to happen here is that the gate is biased to minus 4.2 volts through R-2 or R-3 respectively each 100 K. When RF is applied to these gates gate rectification causes the DC voltage to go a positive RMS value of +2.5 volts.

Now do not be faked out by the loading of the measuring device (meter). Remember that the gate of this MOSFET is extremely high impedance, as high as 100 megohm, so it will not take much meter loading to swamp the voltage back near the bias voltage causing an incorrect reading. We ran into this problem with tube grids in the olde days. A high ohms per volt meter is required. Such meters area VTVM, FETVOM, or a oscilloscope. I just use a scope. Use a X10 probe that has a high impedance. The DC voltage reading will be 10 times that shown on the scope.

I am also suspicious that there might be an error on the diagram. One of us may have to take a working TS-820 apart and verify these readings.

I can't remember, are you getting around + 12.8 volts on the drain of these FETS? This is the FET side of C-8.

BTW, do you have a scope?

Mike,

Basically, yes the 520S has the same power supply diodes.

If the 520S sat for 5 years, diodes are not the main concern, the filter capacitors are. Diodes usually don't fail by sitting around not being used. However, power supply electrolytic filter capacitors can dry out over time. Dried out electrolytic filter capacitors, when full power is applied to them, can cause a puncture to the insulation material between the plates which causes an internal short. If this occurs the current through the diodes can easily exceed the diodes maximum rating and "blow" the diodes.

I recommend using a variable transformer to power up the 520S slowly in 25 to 30 volt increments. Watch and listen for smoke, crackling/sizzling sounds, or the plates of the tubes turn red as you increase the voltage. If the tube's plate begins to turn red during power up, shut the radio off. Usually, but not always, a tube plate that turns red is caused by a failed bias supply (-C supply). When this occurs, there's nothing to prevents the tubes from conducting fully in receive and transmit. Usually the fuse blows but damage can occur to the tubes before the fuse blows.

Hi Walt, thanks for diving into this again with me.

I do have a scope and I will try to get a more careful measurement as you describe and have that data soon.

Looking at the schematic, It looks to me like Q4 and the diodes D1, D2 and D3 are doing double duty. I think the idea is, during receive to bias both the mixer and the driver to an off state. D1 allows the driver grid to go to -9 volts, and the mixer is biased to -4.8 which is much lower than any possible signal. So not only is TIF shutdown during receive but so is the mixer and the driver.

It seems like all of the negative voltage has to come from -C. So -C coming through D3 sucks down the voltage on the driver grid to -9 regulated by zener D1. That seems reasonable.

Then on transmit both lines to the right of D2 and D3 are grounded. And that would pull up the driver grid and the mixer bias to zero volts.... except D2 seems to be going the wrong direction.

And I have no idea why +9 is coming in on the left at R7.

What I think is supposed to happen here is that the gate is biased to minus 4.2 volts through R-2 or R-3 respectively each 100 K. When RF is applied to these gates gate rectification causes the DC voltage to go a positive RMS value of +2.5 volts.
>
> Now do not be faked out by the loading of the measuring device (meter). Remember that the gate of this MOSFET is extremely high impedance, as high as 100 megohm, so it will not take much meter loading to swamp the voltage back near the bias voltage causing an incorrect reading. We ran into this problem with tube grids in the

olde days. A high ohms per volt meter is required. Such meters area
VTVM, FETVOM, or a oscilloscope. I just use a scope. Use a X10 probe
that has a high impedance. The DC voltage reading will be 10 times
that shown on the scope.

No, I take that back. D2 and D3 would set two negative voltage levels
on the driver grid, one during transmit and one during receive.

So I think they are pointing the right direction.

I go back to pondering Q4.

Chris

20242. Re: TS-820S - no transmit FOUND IT!

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-02-16 18:57:16 UTC
From: chris_yipyap_com
Topic: 20236 Message: 20242

I messed that up too....

Ok, in Tune mode line KEY is grounded so to the right of D3 is
grounded all the time. The right of D2 is grounded on transmit
because RLK goes to ground.

I think I've got that right.

Since I have the day off and the local electronics store sells NTE
parts, I zipped over there and bought myself a replacement for Q4.
No change with the new part.

I also measured voltages with my O-scope:

My -6 volt supply reads -5.8.
I get -5.8 on the center conductor of T1 in both transmit and receive.
Same at the center conductor of T4.
At Q4: base -5.14 (both T/R)
emitter -5.8 (both T/R)
collector - 5.8 (both T/R)

On connector RF2 here are the voltages I'm seeing, in TUNE mode:

pin | Transmit | Receive
1 9 | +9.1V | +9.1V
2 -6 | -5.8 | -5.8
3 RB | +2.29 | -3.38
4 RLT | -2.1 | +9.12
5 RLR | +9.11 | -2.35
6 KEY | GND | GND
7 -C | -114 | -114
8 VR1 | -3.25 | -0.90
9 RLK | -3.25 | GND
10 VR3 | -3.25 | -0.5

EUREKA!!!

I found it.

I was trying to figure out where the -114 is disappearing to from the
-C connector to Q4. It must be R12. Has to be.
I'd been measuring the -C voltage through the back of the connector.
When I measured the trace I saw -3.0 volts.
That's not right.

So I examined more closely... and the pin for -C is mangled up inside
the connector and isn't making contact at all. I took the pin out and
the springy part broke off. So I've soldered the -C line to the trace.

Now I've got signal at the tube grid.

I'm so happy.

Now to see if I can neutralize it and

woopee!

Great Find Chris,
I had posted a year or more ago about the problem with the little springy part of the connectors breaking OFF on an 820 I had here.
Again, Glad you found it.

Mike,

I got the Radio at the local Radio Shack/Ham store and they had it up and running before I had looked at it and I just plugged it in and turned it on when I got it home (A Week Ago) and no bad odor or anything thing coming from it. There the ones that told me the history behind it. I've had it on every day since I got it. I did wait a couple of days before I turned the heat switch on. But when I did it loaded up and operated great.
Another note I just took the covers off to clean switches and controls and much to my amazement it still has the factory tubes in it and I don't see any solder tracks. It is super clean on the inside.

Mike,

Basically, yes the 520S has the same power supply diodes.

If the 520S sat for 5 years, diodes are not the main concern, the filter capacitors are. Diodes usually don't fail by sitting around not being used. However, power supply electrolytic filter capacitors can dry out over time. Dried out electrolytic filter capacitors, when full power is applied to them, can cause a puncture to the insulation material between the plates which causes an internal short. If this occurs the current through the diodes can easily exceed the diodes maximum rating and "blow" the diodes.

I recommend using a variable transformer to power up the 520S slowly in 25 to 30 volt increments. Watch and listen for smoke, crackling/sizzling sounds, or the plates of the tubes turn red as you increase the voltage. If the tube's plate begins to turn red during power up, shut the radio off. Usually, but not always, a tube plate that turns red is caused by a failed bias supply (-C supply). When this occurs, there's nothing to prevents the tubes from conducting fully in receive and transmit. Usually the fuse blows but damage can occur to the tubes before the fuse blows.

The TS-502S I just purchased has been sitting on desk for probably 5
years without operation, not in a storage, before I started operating
it again.

Hi Mike,

That is great and eliminates the necessity to slowly power up the 520.

If everything's working fine, full output, not problems, then you have a good radio.

If you later choose to add an amplifier, the 520 will easily drive the amplifier to full output. Amplifier ALC and T/R relay control with most vintage and modern linear amplifier's is compatible with the 520. The only time I would recommend an interface between the 520 and the amplifier is when the amplifier's relay coil voltage is 100 volts or higher and only to save wear and tear on the 520's relay contacts, nothing more. An interface is easily built which can save you a lot of money.

Anyway, have fun and enjoy the 520, it's a wonderful radio.

Yep, that "wire wrap" Kenwood used to make connections to the various
boards will break. Good job Chris.

Hi Kevin,
I sent a TS-820s down to Ken and if it wasn't for a couple of small scratches on the top (they were already there when I sent it) I would swear it was a brand new radio. Great guy to do business with, I was very pleased with the communication and the work that was done by him. I can't recommend him enough.

Mike,

After operating the 520s for a couple of days the only thing that I can tell is while receiving it sounds like bleed over coming out of the speaking, but when I turn the volume control the receive comes back I did take the top and bottomoff and sprayed contact cleaner in the volume and turned several times but the radio still does it, not constantly but on and off. So you think I may need to find another voume/af contol.

Thanks
Mike

Hi,

I had a similar problem with my TS830S, the power output suddenly fell off last week from 120W to 20W on SSB. Previously, I had encountered a situation where if I did not turn on the rig for more than a week, the power would fall off gradually and the ALC meter indication also would drift downwards when in TUNE mode. But the latter problem would Vanish away if I kept the rig ON for 30 minutes.

Initially, I started believing that the tubes had gone soft and the word of Gurus in all forums re-inforced this thought, however, changing the 6146B and 12BY7 did not help, nor did the neutralization.

I was really dreading the task removing the RF board which houses the Drive control variable capacitors and the band switch assy, as it requires a high level of patience and focus.

I got lucky this time and as it turned out, the culprit was the IF board. The IF board contains most of the TX AF, IF and RF circuitry, removing this and a closer inspection of the solder side revealed a myriad of dry solder joints. Tapping the 2 capacitors , C121 and C27, both are electrolytic capacitors, with the board back inside the rig confirmed the dry joints.

After a clean resolder, the rig is back in action in full swing, and the ALC meter kicks up almost full scale on all the bands except 10m. I get just about 70W CW output on 10m, 120W plus on all the other bands with the old tubes re-instated.

I'm not sure what you mean by "bleeder over" but does this occur with
the radio connected to a dummy load?

20254. FS - 814 (VT-154) GE NOS NIB Power Beam Pentodes Guaranteed

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-02-17 15:44:09 UTC
From: Howard Weinstein
Topic: 20254 Message: 20254

Gang,

I have five (5) NOS NIB 814 (VT-154) GE Power Beam Pentodes that are excess to my needs. $21.00 each plus shipping. I can ship one or two 814's in a LARGE USPS PRIORITY FLAT RATE BOX for $11.00 anywhere CONUS.

The 814/VT-154 has a thoriated-tungsten-filament and is typically used as single ended audio amplifier, rf power amplifier, or oscillator. In Class C operation (CW) 1.5 watts of drive will yield 160 WATTS and when modulated 3.2 watts of drive will yield 130 WATTS.

Requires small five-contact socket (similar to that required for the 807) and may be operated in a vertical position base down, or in a horizontal position with pins 2 and 4 in the vertical plane. These 814's are NOS NIB and were manufactured to MILITARY SPECIFICATIONS (milspec) in May of 1954 by General Electric for the US Navy. They are in perfect condition and are packed in their ORIGINAL oversized boxes (tube is almost 8 inches long) with SPECIAL packing "blankets" that are similar to cotton with a stiff corrugated cardboard backing. They will be securely packed and shipped via USPS Priority Mail with Delivery Confirmation.

There is a 100% money back guarantee on these 814's... If for any reason you are not satisfied with these VINTAGE BEAUTIES you may return them in ORIGINAL condition within 7 days of receipt for a full refund of your purchase price less shipping costs.

PayPal to k3hw@...

Tnx es 73 de K3HW

Hello Kevin

I purchased a TS-830s from the original owner, the radio was like new however the band switch coupler was broken and the owner stated that the rig had never been serviced. I contacted Ken about the radio and sent it to him via Fedex ground (Don't use UPS!!) He replaced the band switch coupler, did an alignment and a complete service, he fully tested the rig on the bench and on the air. I have used the rig for a year and a half with no problems still with full output, i have worked stations all over the globe with 100w and a R7 vertical. Ken is a true professional and just a great guy and very helpful!!

Hi folks,

I'm trying to figure out the major differences between the FT-101Z and the TS-520S. It seems the TS-520 has a more relaxed sound on RX. I own a FT-101Z and I'm looking for a TS-520S for the club station PI5ALB. Please Help!

I had Ken go through my TS-520. It works like new.
Ken also talked me through a couple of problems with a TS-830S I
recently acquired. Very helpful.
A true Gentleman and highly recommended.

I have a T599D that has quit on me. also a few other KW hybrids that could use an alignment. After reading the e-mails for a few months it looks to me that a oscilloscope would be very helpful. any suggestions on what to look for in a decent used scope for radio repair work? looking for some ideas on something that will work, but not bread the bank. thanks w0szv

Mike

  I guess I'm trying to say qrm from down or up the frequency, but it is the rf/af Gain control on the front of the radio. I took the knobbs off and cleaned and tightend them back up (pushed the af gain control up against the rf gain control) and now it seems to be working fine.   But I'm still looking for that control to replace the original one.

Thanks
ki0gv

I'm not sure what you mean by "bleeder over" but does this occur with
the radio connected to a dummy load?

A hint about the HC-10 Clock display: The vacuum florecent display on the HC-10 gets "lazy" after being off for a long time. When you get it "going" it's best to dial up 1,2, and 8's and let it set at these settings for a while. This will make them return to full brilliance.

I've had good safe results with Murphy's Oil Soap. I first discovered it when I needed something to clean the interior of a car but was unhappy with the way everything left films and didn't clean very well.

Murphy's cleans very well at low concentrations and hasn't damaged paints or plastics yet.

Hi there -- Clean cabinets can be pretty intense if your not careful. I have a restoration business and here is what I do to try and preserve the finish. First, if there are stickers, tags, markings, etc. use a soft rag with WD40 or better yet - Ronsonal lubricant. This will loosen the glue and remove it without a scratch. It will take some rubbing and time but worth it in the long run. Second, I use 409 with a soft toothbrush. This gets most of the rest. Some folks swear by simple green, but I think either one is just about as good. Once you have the cabinet clean, the secret is "does it look close to its normal color?" then you can go over it one time, lightly with rubbing compound if you like and then several coats of a good hard wax.

Recently, I found a new product that shows promise, McGuires scratch remover --

Anyway, that's my take on it -- I do a lot of cabinets during the year and it seems to work -- GL

Why would you want a amp on 10m? When the band is open, (it hasn't been in a long long time), 80 -90 Watts will get you around the world with S9 reports.

Lysol Basin Tube & Tile cleaner. Wet the cabinet with water first or it will cause streaks... Rinse with HOT water and you will be amazed at the "crud" that comes off. Dry, and then spray with a light coat of "Pledge" polish and buff with a flanel cloth.

I've never had a FT series rig, but understand that they all have sweep tubes for finals amp tubes, AND THESE TUBES ARE HARD (EXPENSIVE) to replace. The Kenwoods 520s use the old 6146 which are still easy to find. This is just one thing you might keep in mind. WA5EDX

Hi. Jerry. You are correct. I worked many U.S. States and foreign countries on 10M back in the early 1990s. 10M was open during daylight hours every day, and sometimes at night also. I was a Tech Plus back then, so of course I wasn't using an amp. My antenna was an 11M "Ringo" vertical. The antenna was so named because it was a 1/2 wave antenna with a ring at the base, and a fixed matching stub. SWR was adjusted by moving a lead around the ring.

My radios were an old Kenwood TS-520, and a Uniden HR2510. I got rid of the HR2510 though, as at the time I couldn't find out how to eliminate the built-in "talkback feature". I still do not have an amp, nor do I have any plans to acquire one in the future. Unlike some, I do not consider an amp necessary. I would rather put my time, effort, and money into better antennas.

The FT-101Z uses 6146B's in the PA. There's probably more gadgets to play with on the 101Z and it has a digital display. However, only the Kenwood has that wonderful Kenwood tone on transmit and receive. In my opinion the Yaesu's always sound a bit squaky.

Topic: 20256 Message: 20277

Hi. Well, having owned a TS-520, and a Yaesu FT-902DM (the final successor to the FT-101ZD) I can give some info. The FT-902Dm did NOT use the 6JS6C tubes like the FT-101E series radios did. It used 6146Bs like the TS-520. While the TS-520 was a better radio than the FT-101E (I did have both at the same time, side by side in the shack), I would have to consider the FT-902DM superior to the TS-520.

Here is why:
The TS-520 was a basic HF radio, while the FT-902Dm was Yaesu's top of the line HF radio at the time. Both were good radios but the FT-902DM had more features, such as a notch filter, IF shift (labled Width), tunable audio filter (for CW, though it was cool for PSK31), and it had a memory that could be used to work split without an external VFO. The FT-902DM has a few features that the FT-101ZD lacks.

Either the TS-520 or the FT-101ZD should serve well.

For those who want to know, I consider the TS-520 superior to the FT-101E series radios. The FT-101E series used 6JS6C TV sweep tubes. At the time, these were easier to get, and less expensive than the 6146B tubed used in the TS-520 radios, but the 6JS6C was not nearly as rugged, nor as tolerant of abuse. The TS-520 that I had always got better TX audio reports and had better RX audio than the FT-101E.

A scope is a very useful instrument and one that you can find for
little money every now and then because they are sold by people that
cannot work with it or have no use for it at all.
About bandwith: for normal work a 2x 20Mhz is very useful, higher is
better, special if you use it for RF measurements instead of a RF
voltmeter, wich it can easely replace.

I use myself a Philips 2x 60 Mhz oscilloscope, because I could get it
for a reasonable price (around $150-200), but for monitoring my
transmitted audio I use a 15Mhz scope that I bought for $30 (Had to
repair it first), and that is more than satisfactory for the most
measurements you will make, because they are all in the audio range.

To look for the purity of a 40 Mhz signal, a spectrum analyser is your
instrument of choice, but will cost more than the rest of your shack.
It all depends how much use you will make of it.

Buy a simple one to start with, and a good book on how to use it to
your satisfaction, you will not be sorry.

That is true of most of the 101 series; however, at least one of the last models used 6146Bs in the final (101EZ I believe).

Another issue was that at least the early models included the 11M band. That made them a popular, no modification needed choice for CB and "freeband" activity, and evidence of abuse are not uncommon. I have an example that I picked up from a yard sale that has a scorched plate choke, and the band switch sections in the PA compartment have a nice carbon buildup around the pads for 11/10 meters. Something else to look for as well.

Hi all,

I'm the proud new owner of TS-530S that appears to be in very good condition considering it's age. Received with the rig was the original Kenwood owner's manual and original sevice manual. Neither manual mentions much about the fan on the rig, other than it having one. The fan on this rig seems to run slow (and extremely quiet) compared to the fans on the solid state rigs I'm familiar with. Since this is my first tube rig, I'm not sure what's considered "normal". Does this sound correct?

Thanks in advance for your replies

Date: 2009-02-18 22:35:08 UTC
From: w5rkl
Topic: 20281 Message: 20284

Hello Stephen,

I recommend cleaning the fan and surrounding area. Over time dust and dirt building up on the fan blades and the surrounding area/components acting as a "blanket". Dust and dirt also reduces the flow of air and slows the fan down.

Turn the power off, let the radio sit idle for at least 10 minutes so the HV can bleed down to zero. Use an insulated screw driver, not a wooden handled one, open the top of the final cage and short the final amplifier's RF choke to ground at the base of the choke. Be careful and don't damage the surrounding components and wiring on the choke.

Use canned air and a small loose brush to remove dust and dirt that has built up over time. There is no lubrication required for the fan just keep it clean. Don't forget to remove the dust and dirt that has collected on the final tubes themselves. A fan will do nothing to keep the finals cool if the tubes are covered in dust and dirt. The fan normally operates quietly, barely heard.

From: chris_yipyap_com
Topic: 20287 Message: 20287

Having finally gotten over my 2 year hurdle, I have some drive coming through the transmit mixer on the RF board.

But not much is happening after that.

I think I probably have problems in the final amplifier circuit somewhere, but I definitely am not getting much out of the driver tube.

So, I figured it was time to go back and make sure all of the tuned circuits were doing their thing to deliver the maximum smoke to the driver and then the finals.

I started with the frequency counter looking at the VXO board to get all of the bands set up on the right frequency. Problem #1 - 80 meters is way off. I'll have to dig into that one and see whats up. Maybe my crystal has drifted. But I can't get it up past about 11.8 Mhz before the little slug is nearly falling out. Everything else tuned up just fine, just a little touch needed.

Then I went on to the alignment of the coils board. Tweaking the "ant" coils makes a noticeable volume change in my headphones. The "mix" coils seem to have no effect at all. On output the driver coils don't do a thing, and the "mix" coils again do nothing. So... Problem #2 - the coil board isn't doing what it is supposed to. I'm thinking maybe it's the bandswitch? I don't know. The Drive knob definitely does have an effect on both receive and transmit. So at least some of the tuned circuit effect is in play.

more of my TS-820 saga as it develops....

I have a Tektronix 475 (200 mHz) just like the one I used as a technician in the early 70's, when it was state-of-the-art. The 465 (100 mHz? or 150?) is the same except for the bandwidth.

Built like a tank. I see them on ebay selling anywhere between $75 and $400, depending on condition. MAKE SURE YOU GET DECENT PROBES!

One thing about a scope - as long as you don't need to use it for accurate voltage or time/frequency measurements, you don't have to worry too much about calibration. A lot of what I use mine (which hasn't been calibrated in 25 years) for in radio repair is looking at waveforms and null/peak adjustments - all relative and not absolute measurements. If I had the standards, I could calibrate it, but who has standards?

Exactly, a 3db gain forward on a small beam or yagi is equivalent to 160 -190watts on 10m. Six db is equivalent to 360-380watts on 10m and all of this from your original 80-90watts. Antenna's like this can be tuned to do even better. Now, move to 75/80m or 40m and the game changes considerably. A good amp in these bands will put your signal S9+20 above the noise floor and you will attract a lot of CQ's.

Gordon,

After reading your email, I did some research on Rich Measures web site....he certainly is a perfectionist and seems an expert in amplifier design and operation. He lists more than 10 mods he would make.

To get another perspective, I then went to the QRZ web site for 922 postings to read some comments on his many recommendations to mod the 922 to implement various fixes. Seems that several of the recommended mods are "life saving" in nature, while others are important only if you use your 922 in certain modes.

As Rich points out, any of the mods void the warrantee,,,,,,but are any in force at this point in time?

I would be interested if anyone knows an expert who does the "Measures" mods for a fee....

Fried the front end of my 830s.....had another radio on and xmitted....830s was turned on (no ant) and ooopppppps overloaded the front end. 830 does not rcv now and calibrator doesn't even move s meter.....so I'm guessing I blew out the 160 meter coil, (common problem) maybe the mosfet next to it.
Any one know where I can get these parts??

I need helpppppppp BOB N3OO

20293. FS - SCAF-1 Audio Filter by Idiom Press EXCELLENT CONDITION!!!

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-02-19 16:11:30 UTC
From: Howard Weinstein
Topic: 20293 Message: 20293

Gang,

I have an Idiom Press SCAF-1 Audio Filter that is now excess to my needs. I used it extensively with my Kenwood TS-520S which now is temporarily residing with Ken K4EAA for it's 30 year check-up.

The SCAF-1 is probably THE BEST audio filter on the market today. It is a cosmetic 9.5 and an electrical 10.0 and it meets or exceeds factory specifications. In other words it works GREAT!!!

$65.00 includes shipping via USPS Priority Mail with Delivery Confirmation anywhere CONUS.

Satisfaction Guaranteed or your money back less shipping costs.

I prefer payment via PayPal to:

k3hw@...

as this allows me to create a shipping label and get your SCAF-1 Audio Filter to the Post Office within hours instead of days!

Tnx es 72/73 de K3HW

Check the 1st oscillator output with a RF voltmeter - I have found some old band oscillator Xtals from Trio or Kenwood dead.

If it's that issue, order one from a good supplier or try to find a semi-dead rig for spare parts.

From: radioman1759
Topic: 20300 Message: 20300

I have a Kenwood TS-530SP ham radio transceiver for sale. It has the narrow ssb filter in addition to the regular filter. It is in very good cosmetic and working condition with no known issues. I have replaced the original high voltage capacitors with new ones. I have the original instruction manual, service manual, and box for it. I am also including the matching speaker SP-230.It does not have the original box. Both units have a few minor scratches on their tops. I'm asking $500 for both units plus shipping (I'm guessing $40-50, this is heavy). If you want to buy the radio only, I'm asking $400 plus shipping. I'll sell the speaker for $100 plus shipping by itself. I have photos if you like. You can reach me at radioman1759@....

Hello Group,
I have a TS 830S with the following problems.

The display is ok every where except on 10mhz and 21 mhz where iot is dark
and blank, with no receive and transmit.
From the service manual I gather that 7mhz 10mhz and 21/24 mhz both
bands share the same vco and associated components.
Q1 for 7/10 and Q6 for 21/24 mhz.
I have tried to do the VCO adjustment as per section 9 of Page 35 of
service manual, but the display does not come on 10 and 21.
Since I am new to this rig , any indication from you experienced people
will be most welcome.
Regards
Jacky 3B8CF

Hi Mike. In the manual to my TS-530S on page 25 there is a section labled "Fan Motor Lubrication. In that section, owners are advised to dust out the final compartment and apply a drop of light machine oil to the front and rear fan motor bearings every 6 months. There is also a warning about unplugging the radio, and discharging high voltage.

I installed his several available mods into my 3x 811A amp (Ameritron
AL-811) and everything works as advertised and then some. The negative RF
feedback is flawless and I now drive my amp with a full 100W from my
exciter. No amount of reactance in an antenna system seems to cause the
amp
any headaches now; no arcing, just "auto foldback" as if it were a modern
solid-state PA. I spoke with him a good bit regarding the mods and their
installation, and he was extremely helpful, while not just outright giving
me "tab a, slot b" directions (so I actually learned a few things!)

> I would be interested if anyone knows an expert who does the
> "Measures" mods for a fee....

Not sure I would qualify as an "expert", but I have quite successfully
installed glitch diodes and resistor, replacement low-Q VHF parasitic
suppressors, and a negative RF feedback resistor, having learned more than
enough to understand the inner workings of a linear insofar as being able
to
suss the function and location of the mods despite my amp's schematic
looking fairly little like the ones in his literature. I'd be happy to
install those mods in someone's HF amp, but I think shipping would be the
deal-breaker there. Amps tend to be heavy and a bit bulky, so I'd probably
get a quote on freight before committing to having the amp serviced out of
your local area.

Drop me a private email if you want to pursue my installing Mr. Measures'
kits into your amp. :)

If it's anything like the TS520 cover, it's just an L-shaped bit of metal with ventilation slots in the side and a hole to get at the neutralising trimmer. There's probably some small capacitive effect with the top caps of the PA valves, and obviously it keeps prying fingers away from the 800V anode supply. While I was repairing my TS520, I ran it without the PA cover in place with seemingly no ill-effects (nice clean output, at least) - but I was very careful around those anode caps!

No doubt this will trigger hoots of derision from the purists, but have you thought about just getting a bit of mild steel and making a cover? It won't take long if you've got a decent vice, a drill and a few hand tools.

Gordon

I have bought and sold several and still have a couple of DFC-230's. I was always amazed that they weren't more in demand. The prices generally run $135.00 to $175.00, more or less, in good operating and cosmetic condition with the up/down mic.

I saw one being sold at a swapfest a few years ago, with the mic, with a sign saying it was a 2m rig. I explained what it was; the guy thanked me; then left the sign on designating it as a 2m rig. Oh, well . . . .

20313. LDG AT-200Pro Automatic Antenna Tuner

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-02-21 02:22:29 UTC
From: freddhardeng
Topic: 20313 Message: 20313

I just got an LDG AT-200Pro Automatic Antenna Tuner and plan to use with my TS-520S. I want it to power up with my rig so my question concerns the DG-5 12vdc supply on the rear of the 520.

I use that 12vdc connection now to power my digital display (not a DG-5) but need to find out if it is capable of also handling 750mw to power the tuner. That 750mw consumption is MAX and would occur only if all tuner relays were working at the same time (not likely, or even probable) and would last for only a few seconds. The tuner paperwork suggest a 2a inline fuse. When the tuner is not actively tuning, it 'sleeps' and draws negligible power. Memories are in EEPROMS and draw NO power.

Question: Where can I find the amount of power available that I can safely draw from that (DG-5) supply connection on my 520s?

Thanks in advance,
- Larry - NX3G

Hi Jacky

Has it ever worked for you?
If it hasn't worked since you purchased it, I suspect it maybe a CB
modification.
My 830 behaved similarly on a couple of band settings. I just don't
remember which ones.
If it is the modification I suspect, then check out some of the switches
(in my case, the NB was used) for any
modifications or foreign wiring.
Any additional wiring usually stands out. You know, different coloring,
size, not in the standard cable ties etc.
I hope this helps.
Please let the group know what you find.

Hello Joan,
Thanks for response.
The problem is definitely in the PLL board because when I replace it with a known good one the rig has display every where.
I have tried to adjust T1 which is related to both 7 and 10 but can get response only on 7 but on 10 there is no response and of course no display.
I have also measured the blk line which is low indicating that the pll is in lock condx.
My problem is to get advice from somebody who has ever tweaked T1. Since this is for 2 bands , I want to know how this is done . Guess there must be some compromise between the 2 bands.
Regards and thanks
Jacky

Subject: Re: [TS-520_820_530_830] Re: TS 830 PLL problem

Hi Jacky

Has it ever worked for you?
If it hasn't worked since you purchased it, I suspect it maybe a CB modification.
My 830 behaved similarly on a couple of band settings. I just don't remember which ones.
If it is the modification I suspect, then check out some of the switches (in my case, the NB was used) for any
modifications or foreign wiring.
Any additional wiring usually stands out. You know, different coloring, size, not in the standard cable ties etc.
I hope this helps.
Please let the group know what you find.

> stickers, tags, markings, etc. use a soft rag with WD40 or better yet - Ronsonal lubricant. This will loosen the glue and remove it without a scratch. It will take some rubbing and time but worth it in the long run. Second, I use 409 with a soft toothbrush. This gets most of the rest. Some folks swear by simple green, but I think either one is just about as good. Once you have the cabinet clean, the secret is "does it look close to its normal color?" then you can go over it one time, lightly with rubbing compound if you like and then several coats of a good hard wax.

Appreciate you reply on the cleaning agents. Have received a number
of replies and still not sure what I'll go with. Don't think it will
be WD-40 but like the 409 idea. It really isn't all that bad but as
good as condition the rig is in want to make it look as close to
original as possible.
Thanks.

Well now....

Take the radio out of the cabinet. Carefully remove any and all stickers.

Then..............

Put the cabinet in the dishwasher and run it through the pots and pans cycle.

Heck...I even did that with a radio I bought that came from an SK who smoked....heavily...the radio had an 1.8 inch of nicotine film....Took all the tubes out...removed anything that wasn't moisture safe...relays, etc. and ran it through the dishwasher. It was spotless when done. Lubed all the pots and switches, DeoxIt on all the blades and tube sockets, let the radio sit for a couple of weeks, fired it up and it works great. (FT-101EE)

Yup..the dishwasher can be your friend!

20324. FS - 2 - 30 MHz RF Amplifier 5 watts in 100 watts out Good Condition

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-02-21 20:46:56 UTC
From: Howard Weinstein
Topic: 20324 Message: 20324

Gang,

I want to keep this amplifier out of the hands of CB'ers so it is only going to be listed for hams:

This is a Sidewinder 100 Broadband Linear Amplifier by Hayden Electronics Inc. It works 2 through 30 MHz and will generate about 100 watts with 5 watts of excitation.

It has a broadband receiver preamplifier good for about 21 dB of gain. It is capable of handling CW/AM/SSB input @ a max of 5 watts.

I have used this amplifier in the mobile when I get frustrated or fed up with my QRP gear. It produces a respectable signal on 20 and 40 meters from my mobile and I am only using a couple of Ham Sticks.

$79.00 via PayPal to k3hw@... includes shipping anywhere CONUS via USPS Priority Mail with Delivery Confirmation.

Thank you for your interest

72/73 de K3HW

Hi Jacky

Very good that you have isolated it down to a board. Mind you, you
didn't answer my questions.
Just because a board change fixes the problem, does not necessarily
means that it is faulty.
It may have a track cut or a diode removed as part of a modification May
I suggest this, have the
2 boards side by side, and look for any differences in track
modifications, extra/removed components etc.
There is a variety of mods to get these working on the CB band.
You have to be satisfied and rule out all these possibilities.
Naturally, if this set has always worked for you, and now it is not,
then you can throw out the
modification theory, and look for the fault.
The fact that the PLL is low can be because it is really locked, or
circuitry has failed, and there is
no voltage to be measured. Is the voltage consistent when locked on
another band? You can also
try changing bands quickly and observe if it momentary goes to an
unlocked state.
Happy hunting.

Hello Joan,
Thanks for advice.
The rig has been in use with me for the last 20 years so there was no mods made for cb . One morning it just stopped working on the 10 and 21 mhz bands.I have removed all the boards (except the RF board) and cleaned the plugs with contact cleaner. It is a fault which just developped by it self.
All the voltages specially the VCO voltage on TP 1 on all bands which are working are consistent. For the 2 bands which are not working the VCO voltage is 0.7 volt instead of 2.8 to 6.0 depending on the frequency(lower edge,middle, or upper edge)
I will check the board for cracks.
Thanks
Jacky 3B8CF

I am interested, would you happen to have an idea for shipping to area code 21158? Not
sure of the weight for the TS-530. Thanks

20329. 7 pin remote connector

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-02-23 01:02:55 UTC
From: martin
Topic: 20300 Message: 20329

Hi Guys. Does anyone know if the 7 pin Din remote connector on the TS-130S is a standard size? Anyone know a good source for these? I have a couple of friends that want to have foot switches wired to the remote connector.

Hi Again. I meant the TS-530S, though I think the remote connectors
on several kenwood radios are the same.

20332. Question about tune up procedure - TS 820S

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-02-23 01:51:32 UTC
From: jay_hendershott
Topic: 20332 Message: 20332

Hello group,

I have a tune up question regarding my 820S. When I follow the steps in the manual and as outlined on numerous sites including this group. I find that after loading and redipping until I reach roughly 225ma on the meter, when I switch the meter to RF I find the needle is always pegged tight aginst the stop. I then lower the load control until the needle is close to the edge of full power and then redip the plate control. I then find that the plate current is lower the the magic 225ma number. Is this normal to run into or am I missing a step? Is my needle in need of calibration possibly? Any tip are appreciated.

Thanks

JR

20333. WTB: AT-230 tuner

HI JR. The RF setting of the meter in these radios is not calibrated
in watts or anything. There is an adjustment on the bacl of the radio
for the RF meter reading. Basically follow the tune up procedure in
the manual. Do NOT use the LOAD control to reduce power in CW or Tune
mode. Use the CAR (carrier) level knob. After tune up set the CAR
control so that you have 225ma, and then switch to RF and set the RF
Volt control on the back of the rig so that the meter reads about 2/3
of full scale.

Topic: 20332 Message: 20335

Hello Jay,

As previous stated the RF meter sensitivity is controlled by a pot on the rear of the 820. The pot is located directly above the rear panel's SO-239 antenna connector.

The CAR control is used to control RF output from the 820 in TUNE and CW modes. The MIC gain and ALC circuit controls RF output from the 820 in sideband mode.

The LOAD control should never be used to lower power output.

.
.
I have a really nice TS-830s for sale. Operation is excellent, couple of marks on the case(no dents or dings) face is perfect. Comes with:
TS-830s
Original boxes
Copy of manual
Copy of service manual
Power cord
All switches and knobs are tight. (no VFO backlash very tight) Not the 'Gold' model. You wouldn't be disappointed in this 830.
Will double box and ship FedEx insured.
$425 little help with shipping.
73,
Kevin

Hi all!

Recently I have bought a ts-830s on ebay (seller said the rig has TX fail). When I received it, the power wire is for 13,8 volts and doesn't have the DS-2 option installed. When I'm testing RX is ok, but when switch-on the heater audio and freq. take off. Can be possible what this supply way only is for RX? (I think without DS-2 option the rig cannot get HV for TX).Then I would need to change the pins in power connector to AC 240V operation? Somebody can tell me the pins for 240V?
The manual is not very clear for it.

Thanks
Jose

> The manual is not very clear for it.

The manual has a diagram of the plug, with 110, 240 and 12v operation links.

If it's the same as a TS-520 (and why would it not be?) then looking at
the back of the radio, for 240v you want (view in fixed-width font)

```
E jj
--||
----
--||
NLJ
```

E, L and N are earth, live and neutral
the two pins with "j" above them are linked
the pin with J and the one above it are linked
all the rest are disconnected

Verify this with a manual before you start though.

Topic: 20303 Message: 20347

Hello Group,
I resoldered all the point on the PLL board. Fault still the same.
The latest I have found is the the DCBA level on Connector 2 of the PLL is not as it should be as per page 4 of the service manual.
For exemple a band which is working ok the level is ok but for exemple 10mhz which is not working gives 0011 instead of 0111.
I have removed connector 2 and measured directly from the plug , and I find the level ok but when I put back the plug the level is not good.
Is it possible that IC Q16 is faulty and is loading the band data? One more thing, the blanking signal is High when lock and low when out of lock.
Your views are welcome.

Subject: [TS-520_820_530_830] Re: TS 830 PLL problem

Hello Joan,
Thanks for advice.
The rig has been in use with me for the last 20 years so there was no mods made for cb . One morning it just stopped working on the 10 and 21 mhz bands.I have removed all the boards (except the RF board) and cleaned the plugs with contact cleaner. It is a fault which just developped by it self.
All the voltages specially the VCO voltage on TP 1 on all bands which are working are consistent. For the 2 bands which are not working the VCO voltage is 0.7 volt instead of 2.8 to 6.0 depending on the frequency(lower edge,middle, or upper edge)
I will check the board for cracks.
Thanks
Jacky 3B8CF

Hi Joe , just an idea.
Have you tried cleaning it and chemical tinning. The same chemical
tinning agent you can use on pcbs.

From: cparrish104@cfl.rr.com
Topic: 20350 Message: 20351

Hi Steve,

Don't have any direct experience but the TS-530S brochure lists the VFO-240 and the VFO-230 as accessories. The DFC-230 is not listed.

20352. WTB: Clean, fully working TS-830S

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-02-26 16:54:26 UTC
From: Jeramy Ross
Topic: 20352 Message: 20352

Hello all,

I need a clean and fully working TS-830S. Cosmetically it needs to have an unblemished face and nothing more than a few scrapes/scratches on the case (I.e. Normal use marks on a well taken care of rig). Electrically it needs to be 100% and with no modifications (other than the addition of filters and the enabling of the WARC bands if done which would be acceptable).

If any one has one for sale or are willing to sale, please let me know the details of the rig (pictures are always appreciated) and how much you want for it.

Thanks in advance and 73s
Jeramy / W5XTL

I'm a full time CW'er and my FT102 is giving me some problems!
Simply, when I key either PC, strait key, bug or keyer, I switch in TX for 3/4 seconds and the VOX release the TX and I do not have any side-tone. I tried to change frequecy, change level, but nothing doing!
So, does anybody with a possible solution on the list?
Thank's in advance

From: w5rkl
Topic: 20353 Message: 20354

Hello Bob,

The FT-102 is a Yeasu transceiver. However, a quick review of the
FT-102 schematic appears that the sidetone oscillator transistor, Q05,
on the FT-102's AF board may have failed. Q05 is a 2SC1815Y small
signal NPN transistor.

That's all I can come up with at the moment.

20355. Sad discovery tonight while using my 820S

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-02-27 05:47:18 UTC
From: jay_hendershott
Topic: 20355 Message: 20355

Hello Group,

While using my 820S tonight which I recently purchased I decided to switch bands and try the 10 meter positions. To my dismay when I selected the 29.000 Mhz position the digital display switched to 27.675 Mhz. I could not believe my eyes. I verified shortly after that this was not a dirty vfo issue or asign of failing eyesight. I was able to tune the upper end of the 11 meter band to roughly channel 32. The 29.500 Mhz position works as it is supposed to. Only the 29.000 Mhz position has been modified. I am wondering if this is a crystal mod or something more serious. I would like to get this corrected asap. Any help on where to start is appreciated.

Thanks

JR

Jr -- How sad but true-- This happens all the time, and the funny thing is that when anything comes into my shop for repair, or upgrade, the first thing I check is for CB crystal changes. I have a written hard policy that anything I work on, for any reason, will be stock amateur band. If not, the customer has two choices, take it somewhere else or it goes back to stock! I know that seems harsh, but I won't be responsible for these radios that have been altered out of band. And it really puts me off, to say the least!

But all is not lost, most likely, it is the crystal and you can get one from West Crystal in Vancouver Canada for $11.00. Nice people. Good product too. Then stcik it in there and do a re alignment of the 10 meter band and your good to go.

Sorry, for the long answer -- GL

Look where the 10 meter crystals are suppose to be place in the 829s. Some CB'er has replaced them with those that will work on 11 meters.

The correct 29.0Mhz crystal frequency is 34.5Mhz, X9, and the crystal
is located on the PD unit inside the PLL assembly.

After replacing the crystal perform the alignment of the 29.0 band.

20360. TS 820S IF Brd Harnesses

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-02-27 22:27:27 UTC
From: Bill & Becky Marvin
Topic: 20360 Message: 20360

Hi Group I removed the wire harnesses from IFBrd (IF1 - IF5)

IF1 14pin
IF2 14 pin
IF3 17 pin
IF4 5 pin
IF5 ???? (1) 3 wire/pin) (1) 2 wire/3 pin gnd-nc- r1f

When I attach the harnesses I end up with a uncovered pin on the IF5 end pins on the Brd pins.. The schematic
shows no gap pins unless clearly shown on the IF1-IF3.

Any Help?

I'm not sure what you are asking about IF Unit board X48-1150-00, plug IF5. If you are asking if there are any gaps on IF Unit board plug IF5 then yes, there is a gap between IF5 pins 1 and 2 only.

20363. Re: TS 820S IF Brd Harnesses

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-02-28 12:40:50 UTC
From: w5rkl
Topic: 20360 Message: 20363

Hi Bill,

There are no unused pins/wires on the IF board pins and plugs "except" for plug IF2. The number of pins for IF board's IF2 is "5" but the plug, IF2, only has "3". Details about plug IF2 and IF board pins IF2 are covered in the 820's operating manual on page 34. If you do not have the 820s operators manual, you can download it from the following Kenwood website (scroll down to manuals)

http://www.kenwoodusa.com/Support/AMA_Radios/#_

or the following website, again, scroll down and click on the 820's operating manual link

http://www.n6wk.com/kenwood/

Your explanation is a bit confusing about plug IF1. However, here's what I think you are trying to say. You have plugged all the plugs, IF1 thru IF5, back onto the IF board. However, you have a loose wire near plug IF1 that you do not know where it goes. Is that right? If so, what color is the loose wire?

20364. How can I tell if a mixer mosfet is bad?

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-02-28 15:50:11 UTC
From: chris_yipyap_com
Topic: 20364 Message: 20364

I'm suspicious that one of the 3SK41 mosfets is bad in
the transmit mixer on the RF board of this TS-820.

The reason I say so is that I've got really funky waveforms on the
scope on the outbound side of the mixer. If it is supposed to be any
kind of a clear waveform then something is wrong.

So... is there some way to tell if one of the 3SK41 mosfets is bad and
I'm limping on one?

I could replace both, but that will cost about $20 bucks and I'd like
to know if I'm barking up the wrong tree.

Topic: 20365 Message: 20365

Am getting ready to use my TS520 for this mode. Have been able to receive transmissions quite well. However, tuning the rig for a frequency such as 14070.15 kHz is not something I can repeatedly do with any accuracy. Would be there a point in using crystals to control the rig to make tuning quicker?

20366. TS 530S final amplifier self oscillations

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-02-28 14:26:16 UTC
From: yellow_kite
Topic: 20366 Message: 20366

This is my third 6146 tube destroyed by self oscillations. I replaced the original 6146Bs with locally available 6146s on my 530S. Was working fine on 20 M, when I decide to check output on 18 MHz. Self oscillations and Ip shot up full scale, and I lost on of the 6146s. Now the output is about 30 watts. This happens when I have two tubes in final. With just one tube(the other now sits just as a dummy with heater on) there seems to be no problem.

I did the neutralization procedure on 28MHz as recommended, but to no avail. Any suggestions before I risk another set of these hard to find valves ??

Just a word that my rig is wired for 110 V and I am using an outboard step down transformer to reduce from 220V mains. It is quite possible that because of this arrangement the heater voltage maybe a trifle lower than 12.6V.

Measure the voltages on Q1 and Q8's Gate 1, Gate 2 and Drain pins

G1 - -4.8VDC Rcv / +2.5VDC Xmit
G2 - -4.8VDC Rcv / +2.5VDC Xmit

Drain - +13.5VDC Rcv / 12.8VDC Xmit

You might also check the PLL Unit's VCO signal level. It should be .9VDC. A missing or very low VCO signal applied to the RF Unit's "VCO" pin can affect the transmit mixer Q1 and Q8.

One question. What prompted you to check the signals at the transmit mixer output?

You could do. I don't bother, because the PSK software generates audio frequencies appropriate for the signal you're receiving - that's the whole point of the waterfall display. If you're that bothered, check the output frequency with a dead carrier in "tune" mode using a frequency counter.

If you think carefully about the nature of SSB and PSK31, you'll see why the frequency is necessarily a bit vague...

Gordon

No reason to. If you really want to keep close track, calibrate your sound card with something like DM780, get yourself one of the AADE digital displays for the 520 (I notice you didn't indicate a 520S, so I think you'd have to get the add-on kit to pull the signal source from the boards), and practice doing the addition of the number on the display and the offset indicated in the software. I usually do this is I use the 520S for PSK, but before I had the AADE display unit I did without and simply didn't have a precise frequency written down. From the QSL cards I've gotten, seems very few people recorded the specific frequency with their setups either, even if they had the capability.

From: chris_yipyap_com
Topic: 20364 Message: 20370

Well, I've had a long history with the transmit mixer in this thing.
Finally just a while ago I figured out it was a connector problem and
I was getting no C- voltage. So the mixer was always biased off. Now
I have signal, but the signal is small and ugly on my scope.

Since there is a balancing thing going on, I am suspicious that the
balancing isn't working.

I'll check the signal levels again.

I think you want heater voltage more like 6v.
But if you haven't rerouted the heater circuit that should be ok.

Do they go wild even with the screen-grid switch off?

20372. FS: Complete TS-820S Station

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-03-01 03:02:45 UTC
From: al_kozakiewicz
Topic: 20372 Message: 20372

I recently bought a new rig and have decided to part with my Kenwood TS-820S station. The items are priced individually, but I'll sell the whole lot for $700, which is $120 off the ala carte price. Shipping is not included. Contact me via email (akozak@... <mailto:akozak@...>) if interested.

Al - AB2ZY

TS-820S - $475

* CW and SSB filters installed
* All switch couplers replaced (by someone else) with solid brass except bandswitch in RF cage
* Bandswitch coupler in RF cage replaced (by me) in 2009 with new OEM plastic
* Driver and final tubes replaced in late 2008. Final was neutralized and transmitter aligned at same time.
* OEM tubes included, plus a spare set of new matched 6146B finals and 12BY7A driver.
* Panel lamps replaced in 2009.
* Octal connector and cable for amp interface included
* Very clean - 9 out of 10 cosmetically
* Includes power cable, original box and manual

VFO-820 - $110

* Recently cleaned and aligned
* Includes cable

AT-200 tuner - $100

* 2 Coax antenna connections
* 1 Balanced line connection
* SWR & power meter
Handles up to 200W

SP-820 - $60

* 2 inputs
* 3 selectable filters
* Clean
* Switches could use a shot of De-oxit

MC-50 - $75

* Clean
* Sounds great!

20373. G5RV Or Windom with a TS830?

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-03-01 14:31:29 UTC
From: waterfield55
Topic: 20373 Message: 20373

Being that I will soon be the proud owner of a TS830, I am wondering what everyone is using for a Dipole style antenna. Putting up a vertical will NOT happen at my QTH. I have plenty of room for a full size 80M dipole. The feed point may end up in the middle of the yard so some coax burying is in my future. I am torn between a G5RV style and a windom. I do not have a antenna tuner as of yet, but that is next on the list. I have heard mixed reviews of the ability of either one to tune some of the bands with out a tuner. But soon as you read the good you read the bad. I know that what works good at your location, may not work at all at mine.

Hello and good luck with the new rig.
I use my TS-520SE for 40& 80 meters only. I use a G5RV (80 ~ 10). It works very well for me.
Good luck with your decision.

Hello all,
I currently use the Heil Pr-20 mic and I like it alot. But for DX-ing, I would like to have the punch of the HC-4 element, like in the HM-10 Dual, or HM 10 c-4.
This brings me to my question... the base of the PR-20 mic has three pins (I believe it's called an XLR). Does the HM-10 or the Hm 10 C-4 also have a three pin plug at the base of the mic?

reason for my question is that the current cord runs through the boom I have. If the HM-10 mic also runs a cord with the three pin connector, all would be FB to just swap out mics on the boom for dx-ing.
I'd appreciate any info someone might offer.

Best 73,

Ralph

Check out the collinear dipole designed/improved by W5GI. I don't have room for a full-size 80m dipole (unfortunately) but this antenna has performed very well for me. You will need a tuner to use it on 80m and 40m but it does work very well indeed. I feed it with about 30' of 300 ohm ribbon line to 50 ohm coax then to the tuner. I use a common-mode choke at the point where the ladder line ties to the coax.

I had also used a so-called "mini-G5RV" but with considerably poorer results. I left it up and did some A/B tests with it and typically, the (admittedly) larger W5GI was quieter and signals were a little over 1 s-unit stronger. How much of this was due to the size I can't say, but clearly some.

73 & Enjoy!

Actually either of these are good antennas. What bI would do is place a Cobra Senior at your local. This is a all band antenna and works just unbelievably great!!. Think of a 3 lead rotor wire stretched out 80' or so. Take one of the outer leads and tie it to the center lead. You now have 160' of wire up. This is how the antenna is made. It is fed however with 450 ladder Line which is no issue, but is not something you want to bury. Google the Cobra senior. You will love it and the design. Brad KB2CHY

Hi Bob,

I would go with the Carolina Windom, I have had on the air contacts with other hams using this antenna and they have a strong signal 599+10 with 100watts. (WA to Wyoming 599+20 w'100 watts) Check out Radioworks website for info.
I use a G5RV and have had good results with it, have had signal reports of 599 with 100 watts. Radioworks also sells this antenna.
www.radioworks.com

There is also the W5GI Mystery antenna that is suppost to be less noisy than other dipoles. www.w5gi.com/mysteryantenna.htm

(Then there is a fullwave loop antenna. I read that one ham put up a loop antenna and his tower and yagi are still in the garage.
With the square loop you need 4 poles or trees with a horizontal or two trees with a vertical delta loop.)

There is lots of information on the web for building all these antennas yourself and alot cheaper than buying one.
I hope this helps, thought i would put my two bits in.

Hope to talk on the air sometime,
73

bob, -- continuing on -- This is what happens when you hit the send button.

Look into the old design dipole, all band antennas, of the past -- you will find that there is an all band dipole, 160 thru 10 meters that will work very well for your needs.
The antenna likes to be up high but that is not the worst thing if you can't make it higher than 50 feet. It will still perform well.

65 fee per leg, at a minimum height of 50 feet in the middle, fed with 85 to 100 feet of open wire feeder, to a 300 ohm tuner. My antenna is at 90 feet at the center and it works quite well. DX is fun and locals can hear me too. If you have the space why not use it?

Good luck on the project -

Rick NU7Z

> I'd appreciate any info someone might offer.

Almost all low-impedance microphones use an XLR connector (designed so that the mic cable can be very long without losing signal level or adding interference to the signal inside the cable, for audio engineering use).

A quick check on Universal Radio's website shows that both the HM-10 and the PR-20 require a CC-1 adapter (which I presume is an impedance-matching xfmr set up as a balun to connect to a mic plug). This means they have to have the same connector at the mic and same impedance range, so they must both have an XLR connector (the photos lead me to believe this as well; I am a former professional audio engineer, for reference).

Incidentally, Heil's products, while very good, are also quite overpriced for what they are. You are paying for ready plug-and-play capability, since Heil has done the homework for you. Same goes for the W2IHY gear. If you'd like to set up a sked with me at some point, I can give you a taste of my audio front end, which uses an Audio Technica studio condenser mic (very similar in audio response to a Heil PR-40), which was $80 new, and my Behringer compressor and parametric equalizer boxes, which were $150 each. Along with a R0de boom ($70), XLR cables (various), a phantom power box for the condenser ($80, but usually built into a mic pre-amp, which most would choose to use instead; there was enough gain in the Behringer boxes to skip a pre-amp box, but you can get a nice Behringer one that can accomodate a variety of mics and mic types for $150), and a box called a re-amper that turns the line level output from the Behringers into ISOLATED high-impedance mic level signal to feed directly into any of my rigs, including my TS-520S ($90). Total outlay for the system, which is far more flexible that anything Heil or W2IHY makes and requires no special cables to interface with rigs (just get a mic connector and solder it up to a cable with a standard 1/4" mono plug to go into the re-amper) was about $650 complete with all cables and connectors, and everything was plug-and-play except having to make the 2-conductor cable for connecting to each rig (I bought shielded guitar

cables for cheap and just attached a mic connector wired correctly on one end for each rig); compare that to the price of a Heil PR-40 with boom and the W2IHY EQPlus + 8-band EQ + iBox + cables for 2 rigs of around $1200!

This antenna is called a doublet and I would also suggest that if you have room for a doublet that it's the first antenna to try.

I recall the late L. B. Cebik stating that the doublet should be every ham's first antenna. Then you have something to compare the ones that don't work so great to.

I agree. After messing around with verticals and various dipoles, off center fed dipole(windom) and G5RV I can vouch for the simple doublet. A number of operators in my local area feel that it's a great performer even if you can't get it too high off the ground. My doublet is a 24 feet and fed with about 30 feet of wide spaced (6 inches) home brew ladder line. Works well for me, I only run 100W and when I hear them I can work them.

HOWEVER, if you are set on using either the G5RV or windom I would suggest the G5RV. I've read the stuff about difficult tuning etc but can't say I've ever had that problem. I have however had problems with RF in the shack with the windom or OCF dipole. Additionally, at 24 feet I don't think the windom worked as well as the G5RV.

Bob I forgot to add that the windom was quite touchy to operate on
10m unlike the G5RV. The doublet is also a bit tricky on 10m but is
fantastic on 20m and 15m.

Hey, Lou -- The tuning on 10 and 15M may be due to the length of feeder your using. Due the math -- you may find that is a
couple of feet short for those two bands and that you are trying to make to much length to get there --

Just a thought -- rick NU7Z

Subject: Re: [TS-520_820_530_830] Heil Microphones

> wow and my heil only cost 100 bucks....

The PR-40, which is a dynamic mic with some of the benefits of a condenser mic (it's also rather similar to the well-known Electro-Voice RE-20), has a retail price of $380. Add in Heil's $110 boom arm, all the cables, and the W2IHY boxes (the three together are over $700)... By comparison, I got the same end result as with that $380 Heil by spending $80 (not counting a preamp, which both mics need -- I alleviated part of the need by taking advantage of other gear in the chain).

You can get a microphone pretty comparable to the Heils you mentioned for as little as $50 or 60 new if you know what to look for. Of course, most hams don't know a whole lot about commercial audio for studio or live sound reinforcement use, so they can't pick ten mics out of a catalog with 200 mics in them that they know would work for what they want to do, which is why Heil has so much of the ham market -- they present their gear directly to hams already "filtered" so the consumers don't have to learn and sort prior to choosing, and for that Heil charges a premium. W2IHY even moreso! But you can increase your AVERAGE signal level on SSB from about 5 watts with a 100W PEP rig to over *20* watts average, which is 6 db of gain without adding an amp or antenna; and that's not to mention what shaping the audio response can do to make your voice stand out above others in a pile-up or for working weak signal DX on SSB. By comparison, this would be the
same as leaving the audio alone and adding at least 400W PEP of amplifier, and won't cost you nearly as much in electricity to run the assemblage, nor will you have to increase the current-carrying capacity of your feed lines, tuner, antenna, ground system (if you run a vertical), etc. So despite the costs, it can make all the difference at a far lower cost in terms of purchase and operation vs. adding amplifier power or a higher-gain antenna. I've turned off all the audio processing in a pile-up, spent half an hour calling without being heard, turned the audio processing back on and busting the pile-up in one or two calls -- on more than one occasion, no other changes. I run a 600W PEP amp that has low buy-in and operating costs and a multi-band trapped vertical because of the physical limitations of my rental property, and with my audio processing I put out as much signal as if I had a two-element beam and a legal limit amplifier. So I consider my
money very well-spent on the audio front end gear, especially considering what it would cost to get the same results with the "industry standard" stuff for Amateur use.

YM, of course, MV. :D

I had thought about the doublet, but lacking a tuner for now I may
just home brew an 80 M no frills dipole. At least I can listen until
I have a tuner.

> 85 to 100 feet of open wire feeder, to a 300 ohm tuner.

One note. In modeling dpiloe antennas, I found that you can get the same take-off angle and gain pattern and RF gain as a dpiloe at 1/2 wavelength above ground by instead running the dipole at 1/4 wavelength plus one foot above ground, and running an identical dipole (except with the ends joined at the normal feed point location, and no connection to a feed line -- essentially, a reflector element) at 1 foot off the ground directly underneath it. This may work with other antenna designs that are based on the dipole principal, like the doublet or OCF dipole, I have not modeled them to be certain. Might be worth looking into if you can't get your dipole-based antenna or long wire up high enough off the ground to be effective on the lowest bands you want to work...

Those who have mentioned problems with RF in the shack with various sorts of antennas (OCF dipoles and verticals often being potential offenders) should look seriously into adding a common mode choke at the feed point, if using a coax feeder, or at using a balun at the wall of the shack and feeding coax with a common mode choke into the shack rather than running the balun at the back of the rig and running twin lead from there out of the shack to the antenna.

From: Kevin King
Topic: 20373 Message: 20392

I use a 180' folded dipole in an inverted "V" configuration.

I do not need a tuner and it works all bands with less than 2 swr.

(==========^==========) each leg is 90ft long that is 180 ft of wire folded back. So total length of antenna is 180 ft with it in inverted v I pull it up to 65ft and it does not take much room.

-Kevin

Subject: [TS-520_820_530_830] G5RV Or Windom with a TS830?

Being that I will soon be the proud owner of a TS830, I am wondering what everyone is using for a Dipole style antenna. Putting up a vertical will NOT happen at my QTH. I have plenty of room for a full size 80M dipole. The feed point may end up in the middle of the yard so some coax burying is in my future. I am torn between a G5RV style and a windom. I do not have a antenna tuner as of yet, but that is next on the list. I have heard mixed reviews of the ability of either one to tune some of the bands with out a tuner. But soon as you read the good you read the bad. I know that what works good at your location, may not work at all at mine.

Ah, the joys of my illness, combined with a broken spell-cheker in my mail program.

Obviously, I'm talking about dipole antennas. ;)

If you live in or near a town, you will most likely have receiver noise level problems. This is a problem the plagues most hams. After years of using a dipole, I bit the bullet and strung a 75 meter loop around my city lot.

It was the best decision I ever made about an antenna. My noise level dropped from a normal of S6-7 to an S1-2. That makes a huge difference between barely hearing someone and armchair copy. I can also tune this to any band from 75 meters on up. The one exception is 15 meters. I suspect my tuner is not up to it.

A friend I talk to all the time put up a folded dipole for 75 meters and got a lot of noise reduction. I have not personally tried this, but he loves the reduced noise.

Hi,

I have been following this thread with interest.

Can you please supply specs for your Loop Antenna?

I have a huge QRM problem on 80M and this may just be the answer I am looking for.

Thanks and 73

Alan

Here is some info on a loop antenna. Look towards the bottom of the page.
http://www.dxzone.com/cgi-bin/dir/jump2.cgi?ID=7489

You can also Google "skywire loop" and find lots of info on them. I have a 80 meter loop and use coax to feed it from a tuner to cover 10 thru 80 meters. Works for me.

Here is some info on a loop antenna. Look towards the bottom of the page.
http://www.dxzone.com/cgi-bin/dir/jump2.cgi?ID=7489

You can also Google "skywire loop" and find lots of info on them. I have a
80 meter loop and use coax to feed it from a tuner to cover 10 thru 80
meters. Works for me.

20398. Fwd: [TS-520_820_530_830] Loop antenna

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-03-02 04:25:47 UTC
From: kc2aup@arrl.net
Topic: 20398 Message: 20398

Alan,

I also use a loop antenna here at my QTH. I live in a condo, so there are restrictions here. However, my unit is just about up against the woods here. The woods are not owned by the complex, so I went to the town hall and asked them if I could put up a loop antenna in the tree tops.
I explained what it was and was for, and how simple it was to do. They had no problems helping out a Ham operator. I also checked with my association and all they said was that as long as the coax was not touching the ground, there was no problem.
So, I went out to Home Depot and purchased a 500 foot roll of 12 gauge stranded wire. I ran 100 feet of 8X coax out the window, hooked it to a connector then to 35 feet of ladder line. Split the 500 feet of wire in half and started to go around the tree tops. We used a sling shot with fishing line and shot it over branches, pulled the wire after each shot and just went in a loop. When the ends meet up, I spliced them together, heat shrink wrapped them and pulled them up with 3/8 antenna rope. I also pulled up the connector so it was not hanging too low and the kids could not pull on it.
I know 500 feet is way overkill, but if I ever have to cut a piece out because of the wind blowing the trees around, there will still be enough to play with.
Not only can I tune out anything I want, and go without a problem, but at any point on the bands, no matter where I go, the SWR is not any higher than a 2.0, and that is at the extreme. I really do not need as tuner, but sometimes I will tune it out anyway.

I think the loop antenna is a very good way to go. I have never had any problems with it. If I can hear them, they can hear me....

Frank

Topic: 20373 Message: 20400

Since I am just starting out and on a very limited budget. I figure to make an 80M straight dipole, probably either slightly sloped due to the way the trees go or an inverted V. Will be using coax for now. I figured I would have to put a 1-1 4-6 turn near the antenna feed point and another just before the shack. Just when you think you have VHF/UHF antennas figured out. They are kids play compared to HF. I have built all of my VHF/UHF antennas. All of a sudden for HF you get into chokes, balums, coils, and tuners. Gotta love this hobby!!

Topic: 20373 Message: 20401

A G5RV is a good antenna and will work fine but it does require a tuner when used as a multi band antenna.

The "choke" that is usually mentioned with G5RV's is 10 turns of coax 5 to 7 inches in diameter. The turns should not overlap and is mounted at the antenna feed point only. A large plastic soda bottle is a good form to use. Whether you leave the bottle inside the coax coil or not is up to you.

Raise the dipole or G5RV antenna as high as possible. For best performance and radiation pattern, the antenna should be at least 1/2 wave length above ground. To find out what the half wave height is for an 80 meter dipole, use the simple formula, 468/3.8 which is about 133 feet. The antenna will work at heights less than 1/2 wave above ground but the radiation pattern will be affected.

Ground mounted vertical require radials for best performance. A ground mounted vertical will work without radials but it's performance will be greatly reduced without radials. The length of the radials on ground mounted verticals is not that important but the quantity of radials is. Put down as many radials as possible and it doesn't matter if they all are not straight, just put down as many as you can.

Verticals mounted on roof tops do require radials and the radial length must be cut to the frequencies the vertical will be operated on. If the vertical is a 5BTV, the radial must be cut to resonate on each band being used.

Verticals should be mounted as far away from surround objects as possible since the surrounding objects, metal fences, out buildings, etc, will affect the verticals radiation pattern even with a lot of radials.

Inverted Vee, or sloper antennas, radiate the majority of the signal in the direction of the "sloop". Therefore, both inverted v and slooper antennas are "directional". This should be taken into consideration when erecting either of these antennas. The angle between each leg at the center of an inverted vee should be kept as close to 45 degrees as possible. The ends should be kept 6 feet above ground. This can be done by securing the end insulator to a tree limb or body of the tree. Do not use wire from the insulator to the tree as this will upset the resonance of the antenna.

When making a simple dipole, use the formula "468/Freq in Mhz" to determine the "ball park" length, end to end. Each leg will most likely have to be "trimmed" to resonant the dipole on the band it's going to be used on. Apply RF power at the center of the band the

antenna's cut for and note the SWR. Move the RF signal up or down in frequency. If the SWR increases as the frequency decreases, the antenna's too short. Trimming the dipole, simply fold the wire at the ends of each leg, back on the leg an equal amount on each leg until you get the lowest SWR. Then cut the folded wire and secure the ends with solder or you can simply leave the excess wire wrapped around the ends, it's up to you. I've used this method for years. I trim my dipoles for the lowest SWR at the center of the band it's going to be used on. For 40 meters, I trim dipoles at 7.150Mhz. If you only operate CW, trim it for 7.050 or lower, it's up to you.

> radials.

A lot of what's in here has been shown not to be correct under rigorous experimentation by N6LF, Rudy Severns. More radials is not always better, there are definite "wrong" lengths of radial to use (especially if you are only using a few of them), elevated radials are always significantly better than on- or in-ground radials, even if they are elevated as little as a foot off the ground, resonant length is typically unimportant (and on- or in-ground radials are surrounded by a lossy dielectric, so their ELECTRICAL resonant length is much longer than their PHYSICAL resonant length -- in most cases, a physical 1/4 wavelength radial on- or in-ground is about the WORST length you can use), and a ground stake will typically improve the signal strength of your station EVEN if you already have a fair number of radials.

I strongly recommend that people who want to run a vertical read Rudy's research, although it takes some effort to integrate it all and derive specific recommendations from it. His site is http://www.antennasbyn6lf.com and all of his research can be read there without having to register (or pay anything). He also regularly gives lectures on his HF vertical research at all sorts of larger ham conventions -- I saw him most recently at Last year's Pacificon, where he gave a forum on HF verticals.

> I think you want heater voltage more like 6v.
> But if you haven't rerouted the heater circuit that should be ok.
>
> Do they go wild even with the screen-grid switch off?
>

To set the record straight "

1. The filament voltage is 6.3 but they are wired in series making it 12.6

2. Of course no oscillations with SG switch off.

3. It was working okay on 20 and 40 till I decided to try 17M, then it blew the lid off, current shooting off scale and one tube giving up the ghost.

4. K4EAA on his website recommends 6146Bs be used in these hybrids and not plain 6146s or even 6146Ws. I used the one I had handy.

5. The B versions are hard to come by here in India. I was wondering if I could safely use the 6146s till I can somehow get the B variety ?

6. This is easily one the best radios I have ever owned (The others include HW-101, FT 101 ZD. TS 450S, IC 745, IC 706 Mk2G, lately FT 817ND and IC-7000) I still have all of them with the exception of the Heathkit. I simply love the receiver on 530 and despite the fact that I have other modern radios, I end up using 530 most of the time.

7. I am doing this again. Putting a fresh pair of NOS 6146s (Brimar), conditioning their heaters for a few hours before I apply any DC to plates, neutralizing them as per book on 28.5 MHz, never operating it on 17 M and saying my favorite prayers.

Hi Bob,

You really do not need a decoupling for your inverted "V" antenna -- in the old days when we were not very good about
how we did things it was more important, but today it probably won't make any difference. Sure, a balun at the antenna feedpoint
is a good thing to make sure that you have decoupled but it is not absolute. Try it without and see what you get. If you are running a resonant antenna
then it will decouple, as is part of the "V" configuration.

Now that being said, if you plan is to use it as a multi-band antenna, then yes you need the balun. And as you go from band to band you will still have some
current on the coax. This is why many of us are using ladder line and a tuner. This provides a means of "auto transforming" into resonance.

20405. Is there a problem burying coax with other conductors?

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-03-02 19:03:50 UTC
From: freddhardeng
Topic: 20405 Message: 20405

I have 90' of 1½" pvc buried from my shack to the base of my tower.
In this conduit I have only one run of 'buryflex' coax for my current HF
antenna. Now I want to run other stuff out to the tower area and am
wondering if it is ok to put all the conductors into the same buried
pvc together. Here's what I plan on putting into the pvc:

- another run of 'buryflex'. One each for the two HF antennas that
will be on the tower, totaling 2 'buryflex' cables in the pvc.
- one cat-5 cable for my WISP antenna (internet connection)
- one 8 conductor control cable for the HAM-4 rotator
- one RG-11 coax for a UHF TV antenna
- one single conductor #12 TW solid copper to be used from tower
ground rods to the shack's radio ground rods to ensure the same potential

These 6 conductors will easily fit into the conduit, but is there
going to be a problem with this arrangement?

When I listen on the bands, the ones with $200 microphones have the most problems to reach a acceptable audio,

All you really need is a $1.- condenser microphone.
The rest is just a rip-off from very clever salesmen.

My 2 cents,

73, Wim PA0PGA

> The PR-40, which is a dynamic mic with some of the benefits of a condenser mic (it's also rather similar to the well-known Electro-Voice RE-20), has a retail price of $380. Add in Heil's $110 boom arm, all the cables, and the W2IHY boxes (the three together are over $700)... By comparison, I got the same end result as with that $380 Heil by spending $80 (not counting a preamp, which both mics need -- I alleviated part of the need by taking advantage of other gear in the chain).
>
> You can get a microphone pretty comparable to the Heils you mentioned for as little as $50 or 60 new if you know what to look for. Of course, most hams don't know a whole lot about commercial audio for studio or live sound reinforcement use, so they can't pick ten mics out of a catalog with 200 mics in them that they know would work for what they want to do, which is why Heil has so much of the ham market -- they present their gear directly to hams already "filtered" so the consumers don't have to learn and sort prior to choosing, and for that Heil charges a premium. W2IHY even moreso! But you can increase your AVERAGE signal level on SSB from about 5 watts with a 100W PEP rig to over *20* watts average, which is 6 db of gain without adding an amp or antenna; and that's not to mention what shaping the audio response can do to make your voice stand out above others in a pile-up or for working weak signal DX on SSB. By comparison, this

would be the
> same as leaving the audio alone and adding at least 400W PEP of
amplifier, and won't cost you nearly as much in electricity to run the
assemblage, nor will you have to increase the current-carrying
capacity of your feed lines, tuner, antenna, ground system (if you run
a vertical), etc. So despite the costs, it can make all the
difference at a far lower cost in terms of purchase and operation vs.
adding amplifier power or a higher-gain antenna. I've turned off all
the audio processing in a pile-up, spent half an hour calling without
being heard, turned the audio processing back on and busting the
pile-up in one or two calls -- on more than one occasion, no other
changes. I run a 600W PEP amp that has low buy-in and operating costs
and a multi-band trapped vertical because of the physical limitations
of my rental property, and with my audio processing I put out as much
signal as if I had a two-element beam and a legal limit amplifier. So
I consider my
> money very well-spent on the audio front end gear, especially
considering what it would cost to get the same results with the
"industry standard" stuff for Amateur use.

Alan look for the site of PB2BJ, he has some very interesting loops
build that really work on 80. And I can confirm it because I followed
the development of some of this antenna's

chuckles Is that so? Aside from my repeatedly verified FACT that I can break through pile-ups and work with a much weaker signal on SSB with my setup vs. even having a great mic and removing the signal processing... Aside from the fact that none of the Kenwood hybrids came with a "$1 condenser microphone"...

...there's the fact that connecting a condenser microphone of any type directly to a rig without anything else (as suggested by Wim here) would result in NO output at all through the rig, since a condenser microphone requires a POWER SUPPLY to function at all.

I'd take Wim's advice with huge grains of salt, myself, as he doesn't apparently know the very basics of microphone types and how they work.

Sorry but I do not agree that audio processing and a $1.00 mic will sound as good as or better than a Heil. I will take my Heil any day. Brad KB2CHY

When I listen on the bands, the ones with $200 microphones have the most problems to reach a acceptable audio,

All you really need is a $1.- condenser microphone.
The rest is just a rip-off from very clever salesmen.

My 2 cents,

73, Wim PA0PGA

> The PR-40, which is a dynamic mic with some of the benefits of a condenser mic (it's also rather similar to the well-known Electro-Voice RE-20), has a retail price of $380. Add in Heil's $110 boom arm, all the cables, and the W2IHY boxes (the three together are over $700)... By comparison, I got the same end result as with that $380 Heil by spending $80 (not counting a preamp, which both mics need -- I alleviated part of the need by taking advantage of other gear in the chain).
>
> You can get a microphone pretty comparable to the Heils you mentioned for as little as $50 or 60 new if you know what to look for.

Of course, most hams don't know a whole lot about commercial audio for studio or live sound reinforcement use, so they can't pick ten mics out of a catalog with 200 mics in them that they know would work for what they want to do, which is why Heil has so much of the ham market -- they present their gear directly to hams already "filtered" so the consumers don't have to learn and sort prior to choosing, and for that Heil charges a premium. W2IHY even moreso! But you can increase your AVERAGE signal level on SSB from about 5 watts with a 100W PEP rig to over *20* watts average, which is 6 db of gain without adding an amp or antenna; and that's not to mention what shaping the audio response can do to make your voice stand out above others in a pile-up or for working weak signal DX on SSB. By comparison, this would be the

> same as leaving the audio alone and adding at least 400W PEP of amplifier, and won't cost you nearly as much in electricity to run the assemblage, nor will you have to increase the current-carrying capacity of your feed lines, tuner, antenna, ground system (if you run a vertical), etc. So despite the costs, it can make all the difference at a far lower cost in terms of purchase and operation vs. adding amplifier power or a higher-gain antenna. I've turned off all the audio processing in a pile-up, spent half an hour calling without being heard, turned the audio processing back on and busting the pile-up in one or two calls -- on more than one occasion, no other changes. I run a 600W PEP amp that has low buy-in and operating costs and a multi-band trapped vertical because of the physical limitations of my rental property, and with my audio processing I put out as much signal as if I had a two-element beam and a legal limit amplifier. So I consider my

Wim
A Google search of the call sign does not bring anything up.
Also QRZ.com does not show anything either.
I too would be interested.

From: Nu7z@aol.com
Topic: 20375 Message: 20412

Hi Group - interesting thread on microphones --

It equates to using preamps on repeaters, in some respects. If you believe it is better then it must be, as I was told one time.

However, that being said, isn't interesting to note that our radios, unless modified in some way, only pass about 300 to 3K of audio spectrum anyway.
Oh, there are those the will dispute that but, in the general sense it is true. and Wim is correct in that spending all of those hard earned dollars, may not improve your audio at all. Another interesting note here is that, on the morning net on day, a gentleman came on and asked if his audio was OK. The replies were that it was, then he set about to tell everyone that his normal microphone had bit the dust so he rigged up a microphone off of his portable Radioshack cassette recorder so that he could check in !
Hmmmm, well it worked and, if he hadn't said anything, no one would have been the wiser.

Just another input --

Rick NU7Z

Subject: [TS-520_820_530_830] Re: Heil Microphones

When I listen on the bands, the ones with $200 microphones have the

most problems to reach a acceptable audio,

All you really need is a $1.- condenser microphone.

The rest is just a rip-off from very clever salesmen.

My 2 cents,

73, Wim PA0PGA

>

> > wow and my heil only cost 100 bucks....

>

> The PR-40, which is a dynamic mic with some of the benefits of a condenser mic (it's also rather similar to the well-known Electro-Voice RE-20), has a retail price of $380. Add in Heil's $110 boom arm, all the cables, and the W2IHY boxes (the three together are over $700)... By comparison, I got the same end result as with that $380 Heil by spending $80 (not counting a preamp, which both mics need -- I alleviated part of the need by taking advantage of other gear in the chain).

>

> You can get a microphone pretty comparable to the Heils you mentioned for as little as $50 or 60 new if you know what to look for. Of course, most hams don't know a whole lot about commercial audio for studio or live sound reinforcement use, so they can't pick ten mics out of a catalog with 200 mics in them that they know would work for what they want to do, which is why Heil has so much of the ham market -- they present their gear directly to hams already "filtered" so the consumers don't have to learn and sort prior to choosing, and for that Heil charges a premium. W2IHY even moreso! But you can increase your AVERAGE signal level on SSB from about 5 watts with a 100W PEP rig to over *20* watts average, which is 6 db of gain without adding an amp or antenna; and that's not to mention what shaping the audio response can do to make your voice stand out above others in a

pile-up or for working weak signal DX on SSB. By comparison, this would be the
> same as leaving the audio alone and adding at least 400W PEP of amplifier, and won't cost you nearly as much in electricity to run the assemblage, nor will you have to increase the current-carrying capacity of your feed lines, tuner, antenna, ground system (if you run a vertical), etc. So despite the costs, it can make all the difference at a far lower cost in terms of purchase and operation vs. adding amplifier power or a higher-gain antenna. I've turned off all the audio processing in a pile-up, spent half an hour calling without being heard, turned the audio processing back on and busting the pile-up in one or two calls -- on more than one occasion, no other changes. I run a 600W PEP amp that has low buy-in and operating costs and a multi-band trapped vertical because of the physical limitations of my rental property, and with my audio processing I put out as much signal as if I had a two-element beam and a legal limit amplifier. So I consider my
> money very well-spent on the audio front end gear, especially considering what it would cost to get the same results with the "industry standard" stuff for Amateur use.

20413. RE: [TS-520_820_530_830] Is there a problem burying coax with other conductors?

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-03-02 20:16:56 UTC
From: BRENT BAUM
Topic: 20405 Message: 20413

I don't see any problems. Its all shielded, except the ground wire. Some will recommend running the ground wire bare in the soil to reduce induced currents in the other cables and to "bleed off" any charge developing along its length. Of course the shields on the other cables will require proper grounding as well. There are a couple of other groups who talk towers and grounding fairly extensively who may have better answers. Check out "Tower Talk" for one.

Subject: [TS-520_820_530_830] Is there a problem burying coax with other conductors?

I have 90' of 1½" pvc buried from my shack to the base of my tower.
In this conduit I have only one run of 'buryflex' coax for my current HF
antenna. Now I want to run other stuff out to the tower area and am
wondering if it is ok to put all the conductors into the same buried
pvc together. Here's what I plan on putting into the pvc:

- another run of 'buryflex'. One each for the two HF antennas that
will be on the tower, totaling 2 'buryflex' cables in the pvc.
- one cat-5 cable for my WISP antenna (internet connection)
- one 8 conductor control cable for the HAM-4 rotator
- one RG-11 coax for a UHF TV antenna
- one single conductor #12 TW solid copper to be used from tower
ground rods to the shack's radio ground rods to ensure the same potential

These 6 conductors will easily fit into the conduit, but is there
going to be a problem with this arrangement?

- Larry - NX3G

But the £2000 gold-leaf diaphragm condenser mike with valve preamps and oxygen-free grain-orientated copper cables give my SSB transmissions so much more air and depth! It's true I tell you!

I've got about a dozen mikes sitting in the studio here. Some are very cheap and crappy, some are very expensive. The most expensive one cost more than I've ever spent on a car (although that's not saying much, truth be told). I can tell the difference between the *really* crap ones and the rest. Stick it through a 300-3400Hz filter and I doubt I could tell. My favourites are a set of Audio-Technica MB-1ks that cost me about 20 quid for a pair. My recording purist studio-mate hates them - "you can't record my guitar part with that, it's a dynamic mike!" - but that's okay, he can't play the guitar well enough to notice the difference anyway. And there we have it - you can't buy mike technique, you have to learn it.

Those of us with a more technical bent might have read Wim's comment about "condenser" mikes as being more likely to apply to electret mikes. These are far more common in communications equipment than proper condenser mikes, and typically run off their own small battery if they're an "aftermarket" part. Some of them run off a supply in the radio. If need be, you can add your own 1.5v battery and 1k resistor to power it up (they have a tiny FET inside). True condenser mikes typically need a higher voltage and a balanced input - not something you're going to quickly hack together.

Gordon

Wim appears to have been saying that a $1 microphone was as good as any combination of mic and audio processing.
I'll put my $80 studio condenser mic up against any Heil, though, particularly the PR-40. :D There are many mics out there that will equal or exceed the performance of a given Heil for less money, it's simply a matter of figuring out what works well. I am sure you saw my equipment comparison of what I have and what I spent vs. getting equivalent performance from Heil and W2IHY gear. I'm always available for a sked if anyone wants to hear the results. :D I have several transceivers and other mics I can use, can turn off the audio processing, etc. for direct A/B comparisons. Hearing is believing. :)

Hello,

My 80m loop antenna was the best antenna I have every built. The dimensions were 70 ft on all four sides, fed at the corner with 450 ohm ladder line about 35' up. I used an older Vectronics tuner and that antenna was great especially on 17m. Like was mentioned before a very quiet antenna. If you have room you wouldn't be disappointed in this one. (wish I had room for one where I live now.

73,
Kevin

20417. Kenwood AT-230 ATU Help please.

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-03-02 19:37:45 UTC
From: mm3ycg@btinternet.com
Topic: 20417 Message: 20417

Hello group, I have recently bought a Kenwood AT-230 ATU for my Yaesu FT-847 and I've been trying to tune In my radio with a half size G5RV antenna. I have read the manual for the ATU a few times but I am still getting a high SWR indicator flashing on my radio when i TX. Could someone please help me as I think I may be doing something wrong when I am unable to get the SWR down and I don't want do damage my radio. The manual for the tuner doesen't seem to explaing everything too well.

Oooh, you don't want one of those for an FT-847. Better sell it to me cheaply so it can be used with a proper Trio rig ;-) I'll pop over just now shall I?

More seriously, have you checked that your earth is good? You *are* using the "matching" setting and not "through", right?

Set the band switch to the band you're on, and the R and X controls somewhere between about a half and fully-clockwise depending on what band you're on. Half for top band, full for 10m. With the meter set to measure reflected power, tune R and X for the lowest reading. It takes a bit of practice but at least you don't have a pi network to tune as well ;-)

You're not very far from me, so if you get totally stuck drop me an email offlist or get me on CS if you want me to take a look.

> Since I am just starting out and on a very limited budget. I figure
> to make an 80M straight dipole, probably either slightly sloped due to
> the way the trees go or an inverted V.

And that will be a good choice for 80m, and will probably work fairly well on 40m and 20m as well. I don't have a whole lot of spare time right now, or I'd offer to model your antenna for you in EZNEC, but it might be a while before I can try out various options in installation and give you feedback on what would work best for your particular limitations for installation.

> Will be using coax for now. I
> figured I would have to put a 1-1 4-6 turn near the antenna feed
> point and another just before the shack.

Are you running barefoot? Chances are you are going to suffer substantial losses in the coax unless you have a proper RF transformer at the antenna's feedpoint to convert the feed point impedance to the 50 ohms impedance for the coax. That's one of the nice things about using twin-lead; aside from some heating losses in the dielectric material, you get far, far lower feedline losses even with a significant impedance mismatch. You may want to consider using twin lead from the antenna's feed point to the wall of your shack, then having a balun there and running coax from the balun in through the wall to your transceiver. This gives you the advantage of twin lead (extremely low loss even with large mismatch), means you don't have to put a (possibly a bit heavy) balun up in the air, and lets you get the advantage of coax (no RF in the shack with proper balun and/or RF choke, direct connection to most transceivers).

The larger the impedance mismatch, and the more power you are running, AND the lower the frequency, the larger your coax choke will need to be to remove RF from the outside of the braid. Assuming you avoid hitting resonance on some frequency you'll be using (which would make the RF on the outside of the braid FAR greater rather than FAR lesser than with no choke), the choke will have a certain number of db of attenuation at a given frequency. Some choke will reduce the RF on the braid, and more choke might eliminate it, but adding more power, changing to a lower frequency, or increasing the impedance mismatch will increase the signal strength of the RF on the braid. The less RF on the braid, the better, but of course removing RF from the outside of the braid on the coax will not do much to i\ncrease the amount of signal that goes into the antenna. So ultimately it's all relative. Same goes for antenna tuners; if there's not much mismatch, then you
can often run far greater power through a tuner than it is rated for without problems (though for safety reasons I do not recommend this!).

> Just when you think you have
> VHF/UHF antennas figured out. They are kids play compared to HF. I
> have built all of my VHF/UHF antennas. All of a sudden for HF you get
> into chokes, balums, coils, and tuners. Gotta love this hobby!!

V/U antennas are generally more limited in the types that are used. Space and height considerations are far less of an issue, so it's a lot easier to just limit the number of antenna configurations one chooses from. And interestingly, all the same principles apply to V/U antennas; most V/U antennas, especially mobile mag mounts and handheld whips, are really poorly matched to their transceivers! V/U radios today (and most HF rigs as well, actually) have "auto-foldback", or negative RF feedback in the PA section, which just turns down the power automagically when the PA is presented with a bad mismatch and a lot of signal being returned to the finals down the feedline. With a good tank circuit in a tube-type PA (i.e., with components that can handle very high voltages and currents, and therefore high mismatches for a given power level) and ladder line, you can feed almost any antenna design imaginable, of any feedpoint impedance, without worry; you
just may end up with a funny pattern and a lot of spurs on harmonic frequencies, but you will put out a signal on your target frequency without blowing anything up, lighting anything on fire, or letting out any smoke. ;) Coaxial cable makes matching a much bigger issue, since losses are a lot higher (and you can actually light coaxial cable on FIRE with a sufficient mismatch and enough power in -- it's quite possible to do so on many types of coax at notably less than legal limit power for Amateur HF bands!), and of course RF noise levels tend to be higher now than they were before WW II... Efficiency in the antenna system can be good for many db of RF gain, and so can save you a lot of money in the long run where such improvements are possible (running HF mobile, for instance, may not allow you to improve your antenna match and efficiency very much because of physical space and wind load limitations). And the smaller and more automated you want
things, as a rule, the less they can handle extremes, so modern, compact auto-tuners cannot typically handle very large mismatches in impedance; thus having the right balun not only helps lower RF losses to the receiver on the other end, but in many cases are necessary to keep the more limited equipment used more often today within its operational limits.
And of course, it doesn't take much V/U power to make a contact within a reasonable line of sight, so modern mobile V/U rigs with 60 watts output should be capable of overcoming almost any limitations in a mobile V/U antenna system. I have a dual-band onmi whip on the truck that's basically the equivalent of a 5/8 wave on 2m (thus a few db of gain over a 1/4 wave vert), and with it attached directly to the truck roof with an NMO mount, I am full quieting into one of the local repeaters that's about 30 miles away with FIFTY milliwatts. Yes, 0.05 watts. That's 30 decibels of RF *down* on 60W out. So running 60W mobile I could use an antenna system with 30 db of loss in it compared to my current antenna and STILL be full quieting into that repeater. Of course, any system with that much loss in it, unless it's purely resistive loss, is going to cause the rig to fold back its RF output a lot to prevent damaging the finals... But you can have a pretty
poorly matched, lossy mobile setup for V/U and STILL be full quieting into the repeater without any indication to you the user that there is any loss at all -- unless you use a field strength meter at some point and compare to a known signal level generator system with the same field strength meter (unless yours is highly calibrated). So maybe V/U is not really simpler, per se, it just is more forgiving, especially in FM, and unless you go digging, it can be a lot harder to see where loss might be happening. FM covers a lot of problems, and high power for the distance covers a lot more (HF signals have to bounce off of lossy earth AND somewhat lossy ionosphere, sometimes many times, before they reach their destination, and the RF power output of a 60W V/U mobile rig is less than 3 db down from the signal strength of a 100W HF transmitter, yet we expect the HF signal, with the loss from many bounces off of these lossy things, and the much higher
received noise levels of AM, SSB, etc. to travel thousands of miles -- while we only expect V/U signals to go maybe 50 with almost the same RF field strength!)

Just looked at the AT-230 Tuner manual.
The tuning range is 10 to 500 ohm, with a half size G5RV, you are possibly out of the tuning range of the tuner.
Check your ground also, very important

All the best, 73 de Udo (KF4KUL)

Of course you need a way to feed a small voltage to the mike. And a box to put it in with a PTT switch. Better use one of this horrid CB microphones and replace the electrical works. You will be surprised. I use this kind of microphones for years with no problems on several transceivers from FT-101ZD to IC756. A little processing will do the rest.

I am having a F licence(= the highest you can get overhere,including morse) for 43 years now, and building most stuff myself, so think I have some experience even in dx-ing too (322 countries fone confirmed). Why do you think the handy manufacturers all use electrets for years, only because they are cheap and have excellent voice quality. You can test that everyday with your own handy.

For your remark: Aside from the fact that none of the Kenwood hybrids came with a "$1 condenser microphone"...
the answer is that they have, but only make a nice profit on it.

Of course you mileage will vary, as is your good right to do, but it is not the only way.

You find it here:

http://wassenaar.radiogroup.org/users/pb2dj/

It is on QRZ.com too but you have to click the click for more details button.

Have fun

Gordon,

Of course I was speaking over a electret microphone, sorry for the confusion. But at least you know what I wanted to tell.

73, Wim PA0PGA

I also have a rig that passes 50 hz to 3900 hz for which I use this gear, but regardless, getting rid of some of those frequencies and increasing others WILL increase the intelligibility of your speech, and removing frequencies that cause "muddiness" frees up that power in your PA (whether your rig's finals or running a separate PA) for putting out more power in frequencies that increase intelligibility. IT's also true that even the best transmitters do generate some distortion and some harmonic output, and these can actually result in some of your audio signal ending up beyond 3 khz of BW at a receiver, even if you are limited to 3 khz out in your audio filtersing (and the audio filtering in the hybrid rigs is very unlikely to be "brick wall" in any case, meaning you are probably only down about 6 db at 4-5 khz -- I'd have to get an AF signal generator and my scope out and do some poking around to get actual numbers, but a brick-wall filter on AF from the mic is extremely unlikely).

Compression, also, increases the signal level when you are "off-peak"; as mentioned, your AVERAGE power out on SSB without audio processing is typically 3 WATTS with a 100W PEP transmitter. Increasing average power with commpression will, guaranteed, increase your average RF power out. This is what the speech processor on the Kenwood hybrid rigs does, in point of fact, although by doing it in RF, there are some advantages in getting a clean signal without overdriving anything.

If you have equalization at your disposal, you can usually make almost any microphone sound pretty good given the typical bandwidth of SSB audio, especially on rigs like our Kenwood hybrids. If you DON'T, though, then the audio properties and response of the microphone, which are very rarely flat on most microphones, can make a pretty big difference. And this can vary based on the particular timbre of your voice; some people have more "punch" in their voice with certain frequency responses, and others often do better with a different frequency response. And very few rigs give you much in the way of audio equalization on the input signal.

I will agree that there are many mics that can do a pretty good job for the limitations of our Kenwoods, and there's no need to spend $380 for a PR-40 to get that. I consider my mic to be a good buy considering it interfaces easily with the rest of the audio processing I bought, it was cheaper than most desk mics made by Amateur radio rig building companies (Icom, Kenwood, Yaesu), and provides me a nice, flat response that works with all of my rigs (including the ones that can transmit in wide-band FM, 8 khz+ bandwidth AM, etc.), plus I can also use it for recording if I am so inclined -- it's a condenser mic that can handle 144 db spl, so I get most of the benefits of a studio condenser and most of the benefits of something like an EV RE-20 (often used to mic kick drums with their extremely high SPL) on top of the rest.

With a parametric EQ, which I do have, I could get a less expensive mic to give me similar results with the Kenwood, and possibly the other rigs, but I also get build quality and a nice warranty with my mic that a really cheap mic probably wouldn't give me. And I've STILL spent less than a typical desk mic from a company like Kenwood, and I don't see anyone knocking those here...

> Wim is correct in that spending all of those hard earned dollars,
> may not improve your audio at all.

Well, that all comes down to the knowledge and skill of the operator, in both purchasing and in using the gear. Again, I'll sked with anyone who asks and you can hear for yourself how much of a difference the processing makes; I've seen it, I've gotten real-time feedback on it multiple times, and I know I am able to break pile-ups and work weak DX with my audio setup that I cannot without it. And I've spent less on it than I did on my 600W PEP HF amp, and in A/B testing the audio processing usually equals the improvement in signal intelligibility, clarity and level that I get from the power amp. Using both gets me to about the same place as using a legal limit amp, for the operating costs of a 600W amp and at about half the price of a decent legal limit amp. To me, that's money well-spent. I could have gotten the same results by home-brewing the audio chain and using a less expensive mic, but I wouldn't have had it for other uses (both the audio processing and the mic can be used for recording and live sound reinforcement, both of which I have done professionally in the past and still do for fun from time to time), and in reality I'd still have spent about $300-400 to build the stuff, with no warranty and my own time spent on designing, sourcing and building the parts.

For me, the money spent was worth it. For some, they'd rather home-brew. Some think that it's all a waste, but every time I break a pile-up with guys using beams and legal limit amps and I'm running a trapped multi-band vertical and a 600W PEP amp, I know I made cost-effective choices on what would get me what I want without having to build it all myself. Whether that cost/benefit ratio is the same for others is up to them, but there's no way a $1 condenser (or electret), by itself as Wim suggested, will put out ANY audio at all on a Kenwood hybrid -- the rig does not provide power for any powered-element mic. And I guess anyone who buys a stock mic for a mobile rig made in the last 15 years or so is "stupid" by Wim's estimation, because that $70 mic is, underneath it all, a $1 electret element, albeit in a nice case with a reliable PTT button and usually some other radio feature buttons (which to some people are worth extra money so they can run features on their mobile rig without having to stop their vehicle to work the front panel controls).

Horses for courses. I will stake the fact that my choices in buying gear were very cost-effective for the results I wanted to get, and especially so compared to what is typically sold for that purpose.

> would have been the wiser.

I've had people with malfunctioning amps or bad feed line put out "okay signal", and they would not have been the wiser if someone had not been aware that their signal was the better part of an s-unit low compared against their usual signal level in comparison with other folks on the same net. Both the broken amp and the bad feed line would have ended up

being a lot more expensive if they had not been caught when they were. People running HF verticals often have pretty lousy ground systems, but since the difference between a "perfect" ground system and a horrible ground system is often less than 2 s-units, most of them can't tell the difference -- until they start conmparing how much DX each works with otherwise identical systems in similar locations.
Just because the difference may not arise in good-signal conditions on a regional net does not mean they don't exist, nor does it mean they are not important. If they are not important for what YOU do with HF, then certainly your money is better spent elsewhere. That does not, however, mean that spending more than you did was NOT money well-spent for someone else, whose opearational needs and limits may be different from your own. I'd never say someone was an idiot for spending $5k on a tower, rotator and several Yagis, and that's pretty cheap for a setup like that when you include pouring the concrete for the pad and installing the grounding rods and guys, renting the crane for a larger tower section, etc. And certainly there are people who do "just fine" with a simple wire dipole, too. IF these guys get what they want for what ends up being a reasonable expenditure compared to other options, then I think they are probably smart.
YMMV, QED. Best 73. :)

Which is free? Included with the $1 mic that didn't actually come with the case, button and power supply?

> Why do you think the handy manufacturers all use electrets for years,
> only because they are cheap and have excellent voice quality.
They certainly can, but keep in mind that most mobile mics from Icom, Kewnood, etc. cost as much as my studio condenser did retail, and they are, as you noted, an electret element, with a case, connector, PTT button, etc. Are they "ripoffs"? To some people, just not having to source the components and assemble them into a reliable compact unit is worth the difference in price, assuming you can source the connectors and a long-life PTT switch (and that's not always cheap or easy to do, as I'm sure you know).

Adam

I never intended to put someone down, my apologies.
English is not my first language, so a mistaken word can happen and I am known for erratical use of your language.

I just wanted to encourage people that have not much money to spend for their hobby, to use simpler things with good results.

Sometimes it seems that you have to spend a small fortune to get in the air, and that keeps off many a amateur.

With simple things, even homebrewed,a little imagination and operating practice you can enjoy this hobby just as much as everyone else with a bigger pocket.

Let us close the discussion,
73, Wim PA0PGA

And my apologies for misunderstanding.
> I just wanted to encourage people that have not much money to spend
> for their hobby, to use simpler things with good results.
We are on the same page. As mentioned, I could have home-brewed the compressor/noise gate and equalizer and used a less expensive mic and gotten the same results for less than I spent (under $700 if I am remembering correctly); in turn, I spent half as much as most hams spend when going the route of getting that effect with commercially-available gear. In fact, I was originally encouraging hams to look at less costly alternatives to the Heil mics, as there are other brand mics that are functionally equivalent (with warranty, readily commercially available) for notably less. A home-brewed mic is not likely to be as easily able to fill all the roles an XLR-based professional mic could, but indeed, for a lot of amateur use, you could spend less than I did and get similar results (although I will say that knowing what to avoid tends to become more important as you spend less and move from commercially available finished products toward components to build your own).
> Sometimes it seems that you have to spend a small fortune to get in
> the air, and that keeps off many a amateur.
Absolutely agreed. That's one of the reasons I really like the Kenwood hybrids (and Kenwood in general); they are quality rigs with quality construction and features, and the hybrids will let hams get on the air with HF for a whole lot less than newer solid state rigs of far lesser quality of features and construction. And even though it's not anywhere near as cheap and easy to build, say, a tube power amplifier for Amateur HF as it was years ago, there is a lot that can be done with home-brewing for a very reasonable price -- and modern electronics open up a lot of inexpensive new possibilities. I read a recent article where, with a few junk box parts, someone built an 80m CW QRP transmitter out of the parts from a burned-out compact fluorescent lightbulb! And there is the Arduino microcontroller that is now cheap and facilitates all sort of projects...
I was very fortunate in that I recently was able to buy my 600W PA, my audio gear, and a Ten-Tec Orion. Before that, everything I did was on a very small budget (I am disabled and live in disability income), and a lot of my gear was borrowed, or very old, and a lot was cobbled together from what I could find. My antennas were almost all home-brewed. And I still love learning, and being able to take pride in building things myself, even from kits -- like my noise bridge (Ten-Tec), the RF preamp I use for my VHF/UHF scanner (Ten-Tec), and my capacitance/inductance meter (Almost All Digital Electronics). I even built the digital display for my TS-520S from the Almost All Digital Electronics kit, saving me a lot of money over finding and buying a DG-5, and it can be used as a regular frequency counter too. :)

20429. TS830M HV and Ip

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-03-03 10:40:55 UTC
From: kenquad
Topic: 20429 Message: 20429

I have a TS830M which I purchased from ebay about a year ago. When I received the rig I sent it off to Castle Electronice (a very well known electronic repair shop in UK) for a complete check over, and I requested their views on the overall condition of the radio.
The radio was realigned and a few resistors replaced. They described the radio as a "Keeper" and said that the WARC bands had never been activated, the diodes were still intact.
I have been using the radio this past year and have always wondered about the HV and Ip readings on the meter. The HV is reading 970 volts, dropping to just under 900 volts on transmit. The Ip reads 300mV, this is in the CW position when tuning up. Are these meter readings too high. I would have thought the Ip reading certainly is ?.
The radio is working Very well on both TX and RX, and tuning up the radio is very smoothe, no erratic or sudden changes in meter readings. Could it be possible the meter is not giving accurate readings ?.

20430. Re: [TS-520_820_530_830] TS830M HV and Ip

> I would have thought the Ip reading certainly is ?.

Yes, definitely. On my TS-520 and a friend's TS-830, HT is somewhere between about 800V and 850V normally, and no more than 200mA anode current.

> The radio is working Very well on both TX and RX, and tuning up the
> radio is very smoothe, no erratic or sudden changes in meter readings.
> Could it be possible the meter is not giving accurate readings ?.

You can look at the service manual to see where these measurements are taken. The anode current is measured by reading the voltage across the four 20 ohm cathode resistors in the final. If one of those has gone open, then you'll see an excessive PA current. Normally you want to see 200mA across 5 ohms, but if one resistor has failed that would be across about 6.6 ohms giving a reading about 1/3 higher. With the radio off, measure the resistance from the cathode of one of the PA valves to ground. Is it 5 ohms?

Usual poking about with high voltages precautions apply.

Gordon

20431. TS-520SE alignment

Date: 2009-03-03 08:35:27 UTC
From: sv0xbq
Topic: 20431 Message: 20431

Hi,
I've got a 520se that I'm trying to set up but I'm having problems aligning the bands. The 1.8 slugs have no effect on the test signal strength. I've cleaned the switches and everything looks clean and OK. Any advice would be much appreciated.

Chris

20432. Re: [TS-520_820_530_830] TS830M HV and Ip

Topic: 20429 Message: 20432

You mean Ip=300mA, I presume; Not mV.

Check the values and condition (burnt/open) of Cathode resistors: R2, R3, R4, R5.

Also, check the values of divider network R6 and R10.

All these resistors are in the Final stage and any change in their values will reflect an error in the 'Plate Current' meter reading.

Cheers,
/A

20433. Re: G5RV Or Windom with a TS830?

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-03-03 13:29:30 UTC
From: Chris Wyatt
Topic: 20373 Message: 20433

I use a G5RV hung about 35 feet high in an inverted V and have had
great coverage on the 80-10 meter bands with a MFJ 941E tuner of
course. I got it before I researched the Windoms though, and now I
wish I had bought the 160 meter Windom special by RadioWorks. I had to
run a seperate 1/4 inverted L for 160. I hear the Windoms do better
than the G5RV's, but like I said my G5RV does a great job barefoot
with my TS-520S.

Hi Brent
I would run every thing you mentioned except the ground wire .
Depending on how far away it is I would not run that as it could conduct
or radiate. Grounds in my book are short and the heaviest cable possible .
I run a 6 gauge cable from a ground buss mounted on the back of the
shack desk straight threw the floor and out to the underside of the
lower eve on my home {bi level two eves in front} then that goes to
three ground rods that are separated in a nine foot triangular formation
all connections are brazed together and buried under the soil at a inch
or so just to be safe while cutting the grass. So all that is seen is
the ground wire as it runs down the front facade to the first nine foot
ground rod. If I was doing what you are planning I would ground the
shack equipment this way and bond the tower by itself no long
connection in between the two.
just my two cents worth

Anyone have information on the wiring diagram for the CS-1 to a TS-830S?
And do they work compatibly together?
Thanks for any input you all might have!

Don't see why it wouldn't work. Be careful with that gain control, it probably puts out a fairly hot signal.

There are only four pins in the mike connector. Two of them are ground, one is PTT and one is audio. It's not exactly rocket science to figure it out ;-)

> I would have thought the Ip reading certainly is ?.

Yes, definitely. On my TS-520 and a friend's TS-830, HT is somewhere
between about 800V and 850V normally, and no more than 200mA anode
current.

> The radio is working Very well on both TX and RX, and tuning up the
> radio is very smoothe, no erratic or sudden changes in meter readings.
> Could it be possible the meter is not giving accurate readings ?.

You can look at the service manual to see where these measurements are
taken. The anode current is measured by reading the voltage across the
four 20 ohm cathode resistors in the final. If one of those has gone
open, then you'll see an excessive PA current. Normally you want to see
200mA across 5 ohms, but if one resistor has failed that would be across
about 6.6 ohms giving a reading about 1/3 higher. With the radio off,
measure the resistance from the cathode of one of the PA valves to
ground. Is it 5 ohms?

Usual poking about with high voltages precautions apply.

Gordon

John,

That is the laziest ebay crook I have EVER seen. He cut and pasted the
entire text and added two sentences at the end! He seems to have other
stuff for sale, so if I had to guess, the buyer isn't going to get a nice
looking TS-530, but if they are lucky, it might turn on.... I guess that's
better than getting a box with bricks in it.

What is the correct 455 KHz oscillator frequency. The manual says to set TC-4 for 451.3 while others have suggested 453.5.

Any additional hints for the alignment of the processor will be appreciated.

Thanks,

Joe k7mks

Marc,

The IP meter reads current in "milliamps" (ma) not "millivolts" (mv).

The TS-830 is rated at 180 watt DC input in CW and 220 watt PEP input on sideband.

The normal standby (receive mode) HV to the final tubes is 950VDC (949VDC per schematic) and 800VD (798VDC per schematic) at normal full input power in CW mode. These voltages can vary, up or down, depending on your local house line voltage.

If your 830 shows 300ma in CW mode after tuning, you have mistuned/improperly tuned the 830. 300ma is way too high of IP current for the 830 or any of the hybrid.

I should say the little spring looking things that hold the wire onto the component's. The power supply capacitor's has little bump's on the bottom of the capacitor's that look's like they have little crack's in them. Just one little bump on each one? Maybe getting ready to go out?

Hi Mike,

I think that the springs that you talk about are the lead connections that are wire wraped. It's soft wire so just tease out the end at the top enough to get some thin nosed pliers on it and it easily unwraps. You'll then need a wire wrapping tool to put them back if you want it original. I'm sure someone will shout at me for this but I don't wrap I solder the new connection.

Hi Mike,
I think that the springs you talk of are the wire wrapped lead connections. It's soft wire so just tease out a bit of the wire with a small screwdriver and unwrap it with a pair of thin nose pliers. You'll need a wire wrapping tool if you want them back the same. I'm sure someone will shout at me for this but I solder mine back.
Don't forget to ground everything to chassis before you start.
Chris

Subject: Re: [TS-520_820_530_830] TS830M HV and Ip

You mean Ip=300mA, I presume; Not mV.

Check the values and condition (burnt/open) of Cathode resistors: R2, R3, R4, R5.

Also, check the values of divider network R6 and R10.

All these resistors are in the Final stage and any change in their values will reflect an error in the 'Plate Current' meter reading.

Cheers,
/A

Hi Mike,

Many thanks for reply.
Sorry I did not notice the typing error before I posted my message. I did mean 300mA NOT 300mV
(a senior moment Hi).
You were right Mike, I normally tuned up the my TS830M according to the "Tuneup Summary" at the
bottom of page 18 in the manual, which could be described as a quick version of tuning up.
After I read your reply I tuned up my radio LINE BY LINE in the manual and when I checked the Ip
it read 225mA. Obviously I was being extra careful as I was tuning up Line by Line from the manual.

Thanks again Mike.

Regards

Marc.

Subject: [TS-520_820_530_830] Re: TS830M HV and Ip

Marc,

The IP meter reads current in "milliamps" (ma) not "millivolts" (mv).

The TS-830 is rated at 180 watt DC input in CW and 220 watt PEP input on sideband.

The normal standby (receive mode) HV to the final tubes is 950VDC (949VDC per schematic) and 800VD (798VDC per schematic) at normal full input power in CW mode. These voltages can vary, up or down, depending on your local house line voltage.

If your 830 shows 300ma in CW mode after tuning, you have mistuned/improperly tuned the 830. 300ma is way too high of IP current for the 830 or any of the hybrid.

Hi Marc,

No problem, as seniors we do that every now and then and I'm no
stranger to having "senior moments" :).

If your IP meter displays 225ma and the HV is 800VDC at full output
on CW then your 830 is operating the way it is suppose to.

In sideband, while talking into the microphone and MIC gain set to 9 or 10 o'clock, no
processing, you will achieve the normal PEP input.
If your watt meter is not a peak reading meter, don't be alarmed if
the most you see is between 25 and 35 watts, 50 at most. That's
typical for average power watt meters.

It appears your 830 is working properly so have fun and enjoy your
830.

225mA sounds about right. Every radio will be a bit different ;-)

Before I make a mess of things. If I am understanding correctly, if the heater switch is OFF, the transmitter will not function, but the receive will?
I do NOT have a proper antenna to transmit with yet, but I have rigged up a long wire for receive. (I put the mic in the drawer for now).

Hi again Mike,
It never rains but it pours. Now I have lost receive on my 830 and the transmitter does not tune up
as before. I tried tuning up on 40m but the Plate control always ends up in the 9 o'clock position
at the start of the 3.5 segment, if I tune up on 20m the Plate control is dipping at the 7m segment.
Any idea what could have hapened ?.

Marc.

20454. TS-520SE HT query

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-03-07 09:14:36 UTC
From: sv0xbq
Topic: 20454 Message: 20454

Hi everyone,

I'm chasing a low TX power problem on a TS-520SE. I can only put out around 80 watts cw on 20m. I had the driver tube out and after putting it back I got over 200 watts for one time only so I think I've got a dry joint or bad connection somewhere. I've just had a DVM on the HT and I get 900 volts off load and 780 volts keyed. Is this normal? Also where can I find the HV filter caps?

Thanks for any advice

Chris

Whilst on receive /no heaters My set developed a s/c blew input fuse .after bringing up slowly with variac i was able to locate a h t s/c leak to ground chassis on the tag strip in pa which takes ht input cable and links to valve . During this time i lost all l t supplies ie no 12 volts dial bulbs etc . haveing removed sc by redressing suppy off tag strip I am now able to run at 250 volts tx not overheating BUT

Whilst i have display in 14 mcs band this does not change But frequency is ie i can tune and receive stations .Dispite which band position I select the read out remains on 20 meter {i can tunein signals on 40 meters still same read out .
All buttons checked and appear to work ok
As i have spare counter unit I substituted this JUST the same A quick check on voltages appear ok . It gives the impression it is locked out It was on 20 meters when it originally failed .all 20 meters sound ok s meter works etc . I wonder if some consequential damage was caused when set failed .sorry so long winded but these are the facts as i see thanks Bob G8ACQ

20458. TS830M Problem with TX/RX

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-03-07 19:25:41 UTC
From: kenquad
Topic: 20458 Message: 20458

My TS830M has a problem with TX and RX.
On receive I only hear stations very weak in the background.
I tried tuning up on 40m and everything seems fine while in the TUNE position. When I switch to the CW part of tuning up, as I increase the LOAD control the PLATE dip point moves anticlockwise until it reaches the 9 o'clock position, below the 3.5 marking on the Plate control, no where near the 40m segment. On 20m I get a similar result and probably on all other bands as well. While tuning, the Ip reading goes no higher than 150mA. There is an indication of Power Out on the 830 meter, but
no indication on my external power meter. The external power meter is
a Radiocraft 3000 Pro and is in working order. When I switch from Receive to Send I can hear the click of the relay. The bias is 60mA.
Any help would be appreciated.

Marc.

Golly that's an interesting one, I'd never considered that fan ever packing up.

My first thought would be to repair rather than replace .. I'm not sure but I think those bearings are phosphor bronze. Your local appliance shop might have something suitable, or at least something you could modify to do the job.

You could rewire it for a 12v computer power supply type fan, and really anything would do, but personally I'd go for fixing the one you have there.

I sincerely hope it didn't start growling at you during a late night dx hunt, spooky when that happens :-)

Cheers and good luck,

Adrian / ZS1TTZ

Hi Richard,

Original used replacement fans come up from time on ebay and VK ham,
I think that would be your best chance for a repair. I don't think
you'd be happy with non-genuine replacements unless you can get
something that runs really quiet. Not sure if you had a good look at
the fan yet but as others have indicated it's worth a try.

Good luck

Lou

Try giving the bearings a clean up and a drop of oil or very light
grease. It might be possible to get someone to make up new bushes out
of sintered bronze.

Gordon

My first suggestion would be to clean the fan and final amplifier using a small light brush and canned air. A vacuum cleaner can also be used to remove the dust as it is brush off of the final amplifier components. Canned air will remove any residual dust and is left.

Unplug the fan from the rear and remove the fan. Further clean any remaining dust then apply a light machine old to the fans bearings then rotate the fan blades by hand to allow the oil to get to the bearings. If the fan rotated freely, clean away any residual lubrication with a cloth and/or cotton swabs and reinstall the fan.

Use only enough lubrication to do the job. A small amount is all you will need. Do not use the liquid wrench "foaming" lubrication. Sewing machine lubrication oil works very well or the oil that comes with beard trimmers also works quite well.

While you have the fan on the bench, clean around the fan opening with a damp cloth, removing any remaining dust and dirt. Clean as much of the final components as well. Don't forget the tubes, clean them as well.

A coating of dust on components and tubes act as a "blanket", trapping heat "in" and not allowing the fan to do it's job.

Does anybody have a user manual, schematic, specs or other usable info on the Kenwood ST-1. It is a desk stand for HT's. Working on a friends HT-215 and he is using a ST-1 with it. He got it used and doesn't have any documentation. It seems ok, but would like to find some documentation on it for referance. Looked thru my list of manual sites and can't find anything on it. Thanks in advance for anything you can provide.

Don T.

Hi Everyone,

I've found some tuning slugs on the net that look like they would fit the antenna coils in a TS-520SE. They are at www.surplussales.com part number (ICH)SLUG-1. 0.155" x 0.315".

Has anyone tried these please?

Chris

Hello All,
I've joined this group having recently bought a " one careful owner - never raced or rallied " TS 830 . The more I use it - the more I like it - and I can now appreciate why they are held in such high esteem .
It is still producing 100w on the original valves - and I look forward to many years of HF operating . I usually work /P on 10GHz - so this is going to be a completely new experience !

Just wanted to say hello

Topic: 20458 Message: 20473

Further to my previous post.
Could the problem be the antenna relay, as it is common
to both TX and RX,and I get no power out indication on my
external meter, but I do get an indication on the 830 meter,
(or would that be too easy).
I hope it is not L41 on RX.

Marc.

20474. TS830M Problem with TX/RX

Hi Marc.

At 5.5 ohms, your Ip reading will be about 10% high. i.e., for an actual 200 Ma of current through the tubes, your meter would indicate somewhere around 220 Ma. Lots of components and metering equipment are only in the 10% accuracy range, so this is not a situation to be seriously concerned about.

Most resistors increase in value over time, so you can just pay attention in the future if the meter indicates increased Ip for the same power output.

Have fun.

20479. TS-820; No drive on 10 Meters

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-03-10 23:09:30 UTC
From: tyhill@ymail.com
Topic: 20479 Message: 20479

Hello all,

I need some advice on troubleshooting a problem. When I try to tune up on 10 meters, there is no drive reflection according to the meter. I can tune up on 15, 20, 40 and 80 meters with no problem.

My manual says that I need to adjust the PLL unit and it points me to section 6.4 in the manual. When I turn to this section it is for adjustment of the transmitter and there is a section for adjustment of the transmit drive coil. Is this what I need to do? Should I perform the other adjustments for the transmitter in this section? Or should I do something else?

Thanks for any and all help

Ty - kg9ah

Hi,

If you look on here in Files, Repairs and Alignment, Simplified and quick alignment. This covers adjustment of the coils including the drive coils and it works really good for me except that he doesn't mention the 1.8 coils. Do the 1.8 coils tuned to 1.9 first, then follow the rest of the instructions. Be careful of the slugs as they're like eggs.

I think that I've read somewhere that if your drive tube is getting tired, 10m goes first.

Topic: 20479 Message: 20481

Hold on, stop, don't adjust anything in the PLL unit!!

You said 10 meters does not work, no drive and no RF output etc.

What 10 meter band switch setting doesn't work? Do all four 10 meter band switch settings not work or just one? I suspect only "one".

Have you checked to see if your 820 has been modified for 11 meters? To do this you have to remove the PLL Unit, separate the VCO and the PD Unit PC boards then visually look at each 10 meter PD Unit's crystal to ensure they are the "original" 10 meter crystals. The 820's service manual parts lists, page 34, shows the 10 meter PD Unit crystals. I've listed the 4 10 meter crystals and their frequencies below for your convenience. Check these "FIRST" before you do any adjusting. Simply adjusting the PLL will not fix your problem, at least not at this point. Check the crystals first before you adjust anything. If one of the PD Unit crystals has been replaced with one that allows the 820 to operate on 11 meters, you will have to replace that crystal then adjust the PLL unit.

The four "original" 10 meter PD Unit crystal frequencies are as follows:

28.0 Mhz
Crystal X7 - 33.5Mhz

28.5 Mhz
Crystal X8 - 34Mhz

29.0 Mhz
Crystal X9 - 34.5Mhz

29.5 Mhz
Crystal X10 - 35.0Mhz

Until you can verify that all four of the 10 meter PD Unit crystals are as listed above, adjusting the PLL will not fix your problem but could easily make it worse.

20482. DG 5

Yahoo group: TS-520_820_530_830 (2009)

From: blacklabpupp
Topic: 20482 Message: 20482

Will a DG 5 work on a TS 820 without a digital display? Or is there a suitable counter I can use. Maybe a better one. Someone gave me another 820 without a display. It came from the factory without one. Not knowing hardly anything about Kenwood or these type of rigs I could use some help. I am afraid to tune the thing up. I have read the manual a couple of times but I cant bring myself to do it, afraid to damage the tubes. My only experience has been with QRP and my FT 840 with an SGC amp. I just turn it on and go.
Also where can I get a CW filter? Does anyone make a replacement? What about and outboard VFO, can it be used to get on all the WARC bands?
I also run on battery power here. This model does not have a DC converter on the back. If I can get it to run on DC with my other gear, how to do you go about tuning up the tubes? Do you use the same 60ma on the IP? I know some of you are about to roll on the floor laughing, knowing that I am a real appliance operator, but I need a bunch of advice and help.
Last but not least, how about SSB filter? I forgot to see if one was installed but, does the rig really need one. I am 80% of the time on CW, but a few of my pals are using SSB in the morning. I would like to use it there as well. When someone made the statement " A blast from the past" They were not kidding. Gene

Hello,
I dont have experience with the TS520, but on the TS530 and 830 you can check the emission of the 12by7a driver tube by switching off the SG (screen grid) switch on the rear of the rig, this effectively switches off the 6146 output tubes. Next, turn the meter to alc, turn up the carr.level to about half way, mode switch to tune and flip on the send switch. The alc level should show plenty of drive on all bands. Its normal for the drive level to be lower on the higher HF bands, but this can be increased via the carr. control. Inability to get sufficient drive on the higher hf bands means that either the driver tube needs replacing or the transmit tuning coils need re-aligning. Its usually always the 12BY7a that cures it. Hi,

If you look on here in Files, Repairs and Alignment, Simplified and quick alignment. This covers adjustment of the coils including the drive coils and it works really good for me except that he doesn't mention the 1.8 coils. Do the 1.8 coils tuned to 1.9 first, then follow the rest of the instructions. Be careful of the slugs as they're like eggs.

I think that I've read somewhere that if your drive tube is getting tired, 10m goes first.

Chris

Be advised that low or no drive on 10M is generally the first symptom of a soft or failing driver tube (12BY7A).

The transmitter alignment you are referring to is the correct procedure to align the drive circuits, but if that does not restore proper drive, I'd recommend replacing the driver tube and repeating the procedure.

From: tyhill@ymail.com
Topic: 20479 Message: 20487

Thanks everyone for responding, so here is an update:

Just to clarify some things:
1. 10 Meter worked about 1 week ago on 28.400Mhz using a G5RV antenna and antenna tuner. This past weekend I built a 4:1 balun and installed it. All other bands worked but no drive on 28.400. This weekend I'm going to connect my 10m vertical antenna up and see how it responds. I wouldn't think by adding a balun to a G5RV would make any difference, but that is the only change made in my setup

2. Ordered a 12by7a tube for justin...

3. Last night I decided to try to tune up again. This time I noticed deflection on the power meter of my antenna tuner, but no response on the 820 meter. I was able to dip the plate with no problems. So I tried to adjust the drive by watching the antenna tuner power meter, then dipped the plate. This worked but only go 50 watts out.

4. This radio does not have any mods.

Based upon information here and elsewhere, I'm beginning to think that the 12by7a tube is about to go. This past weekend I was able to work stations on 15, 20, 40 and 80 meters with no problems

Thanks again to all the responses, and will appreciate any further comments.

Email him and ask, I think it should work well on an 820. I have one on my 520S and wonder how I ever got along without it.

Is it worth it to just purchase a junk 820 and remove the counter from it? Will it work with just a change out? I like the counter you directed me to, but will it take working inside the rig with solder and scope. At this time my eyes will not let me do it.

Good Day everyone,..I have a kenwood 82o-s that im having a problem with. One day in the room here i was working on another rig when, i pulled antenna coax from the kenwood to test the other rig. while i was keying the other rig, my breaker to my room tripped..I went and reset the breaker and, on way back to room stopped to pour cup of coffee. When i got back i went to hook antenna coax back to the kenwood when i noticed that the digital display was out. The meter stayed lit and i have a little air noise but, no tx or rx now. im not sure it was the kenwood that tripped the breaker but, when i had coax off the rig i did leave the tubes lit because, i assumed i would have coax off only for short time. I really really love this rig and, im hoping its in the low voltage supply somewhere but, i need to find out where. Any help will be greatly appreciated as, i sure miss the big guy sitting there on my bench cranking out some of the best audio i ever heard in any rig.

Thank you for your time,

Dave.

Greetings,

Can anyone tell where to find details of creating a backup power source for a TS-830. I accept maybe I just need a power inverter to go from an automotive battery. Is there any more clever way of doing this (short of an UPS)?

> >Hi Gordon,..Now go figgure...i read your question and knew that i did not knock the 9 pin plug out of the socket on back but, before i answered you i picked up the rig and checked. It was still plugged in socket but kinda loose a bit so, i pushed it in harder a bit and, fired up the rig and, it works !! Thank you for your suggestion because, i never would have suspect the 9 pin connecter since it was still plugged in the socket. I am a happy camper now lol. Also on this rig, my 2nd segment on display is out. instead of reading 7.250 it reads .250 or, instead of 29.305, it reads 2 .305 im told its just ground prob or something. you ever run into this problem? Anyways, thanx again for your help. Im going to go hook it up now and enjoy. Have a great day.

Dave.

Yes, if the 820S parts radio has ALL 3 of the digital display items listed below and if they all work.

The 820 digital display consist of the following 3 items:

1. 5VDC regulator (includes all mounting hardware, 3 prong plastic plug and wires)

2. Counter assembly

3. Digital display tube (multi-wire plug and wires)

DO NOT cut the wires at the 5VDC regulator's 3 prong plug.

Check the "DH" button below the meters switch. IF it's pushed in, this will happen.

> > >Hi Gordon,..Now go figgure...i read your question and knew that i did not knock the 9 pin plug out of the socket on back but, before i answered you i picked up the rig and checked. It was still plugged in socket but kinda loose a bit so, i pushed it in harder a bit and, fired up the rig and, it works !! Thank you for your suggestion because, i never would have suspect the 9 pin connecter since it was still plugged in the socket. I am a happy camper now lol. Also on this rig, my 2nd segment on display is out. instead of reading 7.250 it reads .250 or, instead of 29.305, it reads 2 .305 im told its just ground prob or something. you ever run into this problem? Anyways, thanx again for your help. Im

going to go hook it up now and enjoy. Have a great day.

Hi, May I remember that any testing is best done on a 50-ohm dummy load.

Using the antenna, especially through a coupler / matcher, give false ideas
of what is happening.

I agree with the 12BY7 comments, but if you change it you'll have to
re-align the TX RF coils.

Hi Chris,
Maybe I'm too late, but you have to follow the procedure per the manual, that is :

1- adjust the cores of the 1.8 MHz coils with the set on the 160 meter band and receiving the calibrator signal at 1.9 MHz with the preselector knob at 12 o'clock,

2- then adjust the 28 - 21 - 14 - 7 and 3.5 MHz Rx RF and Mixer coils slugs IN THAT ORDER with the set receiving the calibrator signal on the frequencies specified in the manual (you can cheat a little and choose to align with the set receiving your favorite part of the band withe the preselector knob pointing in the 12 o'clock position),

3- then adjust the 28 - 21 - 14 - 7 and 3.5 MHz Tx Driver coils slugs IN THAT ORDER for maximum ALC.

If you look at the schematic, you'll understand why : coils are arranged in a series / parallel way, so no other way to proceed.

From: Michael
Topic: 13844 Message: 20502

This is just a note that is not specific to Kenwood rigs. It is a story about receiver interference and the solution.

A few months ago I suddenly began hearing noise on part of the 75 meter band. This was particularly annoying because it was on a freq that I often use to talk to local hams.

I concluded that the noise must be from some power line problem a few blocks from my house because I knew that I had not plugged in any new appliances or electronics in my house. Here in the upper peninsula the height of the snow and cold temperatures prevented me from using my portable short wave radio to go out and track down the problem.

Well, I went out a couple of weeks ago when we had an unseasonal rise in temperature to 38 degrees. I began walking from my house following the power line going to the pole. The closer I got to the pole the lower the noise. Every time I moved away from my home, the noise got less. Half a block from my house there was zero noise.

I went back in my house and used the rf gain on my Grundig short wave receiver. I walked the house back and forth and finally found the noise was greatest in the basement. I then lowered the rf gain even more and was able to walk right up to a switching power supply wall wart used to charge a defunct cell phone. Just lowering the radio's whip antenna toward this power supply increased noise. I unplugged the power supply and suddenly the noise went away and I heard air noise on my radio. I picked up this little wall wart and looked at it. The small end of the wire that plugs into the cell phone had been arcing and was kinda in a black mess. This wall wart failed and began sending 120 vac down into a connector that could not insulate enough to prevent arcing.

The bottom line to this story is to never assume that the noise you hear is coming from somewhere else. Now, if I hear a new noise, I will pull the circuit breaker to my whole house. This is a simple way to isolate the problem. I realize there is the inconvenience of resetting every clock. However, the inconvenience of putting up with an S7 noise level on 75 meters is worse.

I am still kicking myself for putting up with this noise for 3 months before I checked my own house. Never assume that the equipment you have cannot fail and begin causing noise.

Now I have a nice S1/2 noise level on my loop antenna. That is a good number for living right in town.

Michael

Topic: 20504 Message: 20504

I just opened up the TS 820 and found it only has one filter. SSB YG 88s, I looked in the Files and found only a YK 88. Are they the same? What is the width of this filter?
I see on the INRAD page that they offer a filter for the TS 820, I know many think they have the best. But I dont know this rig very well yet, and I am not sure if i should look for the Kenwood original or just take the Inrad.
Also do you have to tune the rig every time you move. Can you move 50kh and not tune. What is the rule for such? I dont remember reading a thing about it in the manual.
Another thing I noticed tonight is the Send/Manual Monitor NB, flat switches, they seem funny to to the touch, are they suppose to be soft and funny filling?
While I have the top off I noticed it all looks so new, the rig has been in storage for 20+ years. What should I be concerned about, or change? Sorry for being long winded but I find this radio more fun than any I have ever owned.
Also does anyone have a DG 1 for sale or know of a place to get one?What I see on ebay is not what I am looking for. Gene

Hi Daniel,

I've sorted this out thanks. It was the first time I'd worked on this
so with the covers off and on it's side in the service position with
the dials facing me I looked at the band markings on the oscillator
coils and assumed that they were the same for the IF, antenna and
drive coils. Wrong. Looking from the rear the IF, antenna and drive
coils are in a different order so I was adjusting the wrong
slugs....... Doh!

I bet I'm not the first to do this.

Chris

Hi Gene,
I'm having similar fun with a TS-520SE. I went around all of the switches and pots with a can of switch cleaner with lube. With the power off I always splash everything to ground before touching anything even when the sets been off overnight. If it all looks good then use it and see how it performs. The flat switches are soft so I don't think that's a problem
I also need a cw filter YG-3395C does anyone know if there is anything I can use instead of this?
Chris

Hi Gene. The YG-88s is the 2.4 Khz SSb filter that is original to the radio. Inrad has filters, but some of them must be wired in, as they are larger than the originals. What type of filters are you interested in? (As in CW, or Narrower SSB).

You need to re-tune the radio if you move more than 50Khz up or down the band you are on.

hi,

most of the inverters put out a square wave or even a
modified sine wave and the transformer in the radio
will not like it.

if your inverter is full sine wave it will work fine.
otherwise find a used APC brand SmartUPS 600 series,
or larger, full sine wave and you can start it from the battery
without any ac power connected.

I have an external battery attached to the ups
with powerpole connectors that can run the ups
for a long time. just don't exceed the capacity of the ups
even if you use an external battery.

Your are very right about this Chris. The end of that arcing connector was about 2 inches from a cardboard box.

20511. AT-230 problems

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-03-13 17:39:15 UTC
From: Todd Wilson
Topic: 20511 Message: 20511

I have a 530s and a at-230 tuner setup. Lately the tuner seems to be having a problem of some kind. I'll try and explain it.....

The signal cuts out. Usually right after I fire up the rig. If I set a cup down on the table or
sometimes hit the table with my hand the audio cuts clear out like maybe the radio is loosing
its antenna connection. If I jiggled, push or move the band switch on the tuner a few times the problem clears up and all is good for the rest of the night. I have cleaned the inside switch
area. Checked all connections everywhere and thought I had it all taken care of as the problem went away for a while but its back. Usually only does it on the 75/80 3.5 setting. Other bands seem to be ok, Everything inside looks fine to me. All clean and no connections appear to be loose. I seem to be missing something and was wondering if the group would have an answer. Thanks

Todd - N0UNI

20512. Tap into 820S for external freq counter

Is it safe to reduce the drive after tuning up to run only 50 watts? When driving an amp or if I only wanted to run 20 watts CW, is this safe. The manual is lacking in alot of areas. How often do you oil or lube the VFO dial? A neighbor told me it was never to be done on Drake line. And he doubted it would ever need it. The files section could use more info on some of these things. Gene

Hi Gene. You use the Carrier (CAR) control to reduce drive in CW.
The mic gain is used in SSB. Do not use the Drive control to reduce
power. The VFO has gears and bearings. They only need to be
lubricated if there is a problem, such as the VFO knob does not turn
smoothly, or is hard to turn. It should turn easily and smoothly from
end to end.

Hi Gordon,

Sounds like a typical display multiplexer problem. Check the display driver chip IC16 (74LS247). One of the output lines will be permanently high or you've got an open current limit resistor. Worst case (but unlikely) you'll have a faulty display unit D13.

You can find a service manual here. The circuit is not too clear but on page 7 and 8 there's a good description of the display driver and pinouts for IC16 and the display unit D13.

Gang,

Please excuse me for mentioning a vintage solid state rig here but I know there are those of you who are familiar with the Atlas series of transceivers manufactured by Herb Johnson 30 some years ago.

I am going to be spending a lot of time in the mobile over the next few months between PA and MA. It's about a 250 mile run every two weeks so I'll have lots "of on-the-air" time.

I want to procure an Atlas-210x or Atlas-215x HF transceiver for mobile operations. Any and all accessories will be considered, especially a microphone.

Tnx es 72/73 de Howard K3HW

If you want to reduce transmit power on SSB, there's a little trick you can do involving biasing the ALC line with a 9-volt battery and a couple of resistors. This is a better idea than reducing the mike gain, because you're reducing the gain of the output stage and keeping nice deep modulation. If you reduce the modulation to reduce power then you've still got all the noise and carrier bleed, and less wanted signal shouting over the top ;-) Have a look here:

http://www.eham.net/forums/BoatAnchors/1455

If your VFO dial is notchy, check that the bearing cap hasn't been overtightened - it's not as horrible a job as you'd think to get at, involving taking all the knobs and the plastic fascia off. I don't think there's quite enough room to get at it with just the VFO knob off. It's great if you want to give all the knobs and panel a good clean, while you're in there.

When I got my TS-520 the tuning dial was very notchy, and felt like it had crud between the gear teeth. Careful inspection with a mirror and penlight torch showed that they all looked pretty clean, but easing off the bearing cap on the slow motion drive freed it up nicely. It needed about 2mm of movement to go from binding quite badly to being a bit too loose and rattly, so be very gentle with it. Have you ever set the head bearings on a bike? Same idea - a tiny fraction overtightened and you're exerting tonnes of pressure on the bearing.

Gordon

20522. TS-830 no power on SSB

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-03-14 17:18:48 UTC
From: waterfield55
Topic: 20522 Message: 20522

I am new to this 830.
It tunes up just fine (using K4EAA procedure). When I switch to USB or LSB I have NO power. I have read all the post about it here and tried all those things. I know the mic (MC-30S)is working, it will trip the VOX. I checked the proc switch and it too appears to be ok. Put the unit into CW and I have full power. I only have a dipole cut for 20 meters so I have not checked it on other bands.

Ah yes the newbies strike again!

Well it looks like I will be leaving the group. I lost my barn in a fire this week in the early morning hours. We think it was a lightning hit that started it. Anyway, most of my station was in my shop in the lower level of the barn, including my beloved TS-520S. I also lost my Yaesu FT-101E and late FT-101ZD, two old tube amps, my big power supply, several D104 mikes, antenna switch, cantenna, and my meters and test equipment. In fact the only Kenwood gear I have left is my TS-700 which I know is OT for this group. I am now HF radio-less entirely. And of course I also lost a 50 year collection of tools and shop equipment, three motorcycles, and my wife's car that I had in the shop to work on. The barn actually belonged to my aunt, so I had no insurance on the building, and my homeowners won't cover most of what was there including my ham gear.
I just want to say thanks for having me. I have enjoyed my time here, and have learned a lot.

20524. TS-830S blows fuse when heater switch is turned on

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-03-14 17:28:26 UTC
From: George
Topic: 20524 Message: 20524

Hi, I just joined this group. I traded an amp for a clean TS-830S with matching antenna tuner, speaker and desk microphone.

The TS-830S is beautiful and I love the receiver but when I turned on the "heater" switch the day it arrived, after letting it warm up to room temperature for half a day, the S-meter light seemed to dim a little and about three minutes later the radio went dead. It blew the 6 amp fuse.

When I first turned the transceiver on I smelled something, almost like a burning odor but it went away after a couple of minutes. When I turned on the heater switch I got the same odor for a couple of minutes, but no smoke was seen.

I opened the radio up and found no damage I could see. The original odor came from the speaker vents on the top of the cabinet near the Load and Plate controls. Opening the radio I saw the 12BY7 tube in that location so I replaced it with a new one.

I'm not going to turn on the heater switch again until I can have a tech look at the TS-830S but does anyone have any suggestions about what may have caused the fuse to blow?

The ham I traded with said the radio had worked great in February, the last time he used it. It was shipped really well protected with layers of bubble wrap and there was no evidence of any damage to the outside box.

Thanks!

Have a look on the coupling condenser between the 12BY7A driver and the finals (C01, 100pf final unit). If it leaks, the finals grids are going positive,and the tubes will overload by the resulting high current.
Eventually the fuse blows, but it can also kill your transformer, and then you are in real trouble.

Hope it is just that,

73, Wim PA0PGA

How long after the heater switch was turned on did it take for the dial lamps to dim?

If the lamps dim after 5 to 15 seconds or so then I suspect a problem in the bias supply, blown diode, shorted capacitors, or both.

Check the final amplifier's cathode resistors, there's 4 of them all are 20 ohm 1/2 watt. Since you smelled something burning, I would check those resistors. They will burn up and causes you to smell them burning/overheating if high current flows through the final tubes, higher than normal. High current flow through the tubes in receive can be caused by shorts in the tube or a failed bias supply.

I'm sure we all feel gutted by this but it's early days so stay for
now and see what tomorrow brings. Ham radio is a good community and
worth sticking with and the main thing is no one was hurt.

John,

Things will get better. No one was hurt or injured Thank God.

This is an intelligent and compassionate group. Do not leave us. I'm sure that we can help you rebuild your Ham Station. I'm sure that I can part with a few pieces of gear. I see that you already have an offer of a TS-520. Accept it. When you can - pay it forward...

20536. Possible receive problems on TS-520S

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-03-15 02:51:41 UTC
From: Michael
Topic: 20536 Message: 20536

Hello to the Group,

I think I may have possible Mosfet receive problems on my Kenwood TS-520S. When I first got this radio about 2 months ago. On the volume control once in a while it would really get statically and I would turn the volume back and forth, and the good receive would just come back so I found another control and installed it and while I was inside the radio, I took contact cleaner and cleaned all the contacts associated with the Band selector switch along with many other contacts. Well today I put the radio back up on the desk, When I turned it on the static on the volume control was gone but the receive on the radio isnt what it was not near the signal strenght on some stations like I was getting, I can hear them but nothing like it was. Could it be a Bad Mosfet.

Any Ideas,

Thanks
ki0gv
Mike

20537. TS-820 Digital Readout

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-03-15 03:57:33 UTC
From: jsloss
Topic: 20537 Message: 20537

My 820S's counter struggles to show 15.000 when the set is exactly zero beat w/ WWV. Adjusting TC-1 on the counter mixer board gets it close but not "right on". Another counter module I have works precisely as it should.

The 1 MHz crystal cannot be brought to exactly 1 MHz by the adjustment of TC-1 which is in parallel w/ C-47 - 22 pf per the Service Manual. My correctly working counter has a 56 pf cap for C-47 as does the struggling counter. The crystal most likely has changed frequency slightly over the decades!

I envision trying several values for C-47 until I hit on a value that will tune the 1 MHz crystal correctly. BUT.....before I try this I thought I'd check with the group for ideas that may shorten this troubleshooting episode,

Thanks

Joe k7mks

20539. TS-520S Counter

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-03-15 04:43:04 UTC
From: jsloss
Topic: 20539 Message: 20539

Further to my last:

With C-47 removed from the circuit with TC-1I can only get the counter to read 15.003 at zero beat. It is becoming more likely that the 1 MHz crystal has drifted too far to bring back into frequency with TC-1 etc.
Any small 1MHz crystals out there?

Joe k7mks

Band conditions have been very variable here recently. One day I can get VK's and the States easily and the next there's just nothing there so it could just be a bad day. If it is the set I'd look at where you've been. I'd give the band switches a good "wash" with contact cleaner first and then finish with a light spray of contact cleaner with lube. Does the signal strength peak with the drive at 12 o'clock? The is lots on here about checking the alignment.

20544. TS-530S& AT 120 tuner /procedures to tune

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-03-15 16:10:55 UTC
From: Mic
Topic: 20544 Message: 20544

Antennas are Cushcraft R7 on roof top (25' height), Shorten windom at 20' height with balum, and 20-10 meter diplole at 20'(windom and dipole both slop from 20' to 17' where they are tied off in a tree .Question:what is proper sequence for tuning: tune the 530S first then tune up the antenna? Or tune the antenna first,then the 530? I try it both ways, but after tuning the antenna last, I noticed my last meter setting on the 530 changes, (my last tune up process on the 530 is trying to get 225 ma target).I also have an AT-11 auto tuner that's not in use.Use that instead of the AT-120?
Thanks for the help.
WA3HDQ, Mike, York Pa.

It was still plugged in socket but kinda loose a bit so, i pushed it in harder a bit and, fired up the rig and, it works !! Thank you for your suggestion because, i never would have suspect the 9 pin connecter since it was still plugged in the socket. I am a

happy camper now lol. Also on this rig, my 2nd segment on display is out. instead of reading 7.250 it reads .250 or, instead of 29.305, it reads 2 .305 im told its just ground prob or something. you ever run into this problem? Anyways, thanx again for your help. Im going to go hook it up now and enjoy. Have a great day.
> >
> >
> >
> > Dave.
> > >
> >
> Ido not have the dh button pushed in but, i have been told by few ppl that i have to pull the readout out of the rig and open it up and, clean around board where grounds meet. guess its common prob with this model rig. Plus, i found and downloaded service bullitins on the 820 that states same thing among other things that need attention. (i would be glad to upload it here if needed for anyone else). Anyway, thanks mike for your suggestion i appreciate it. Also, yesterday i scored a trio 520x that was given to me. found it dosent light up. and, upon opening up the top i found tubes gone and power transformer secondary leads disconnected. my heart sank a little but, not giving up hope. its nice looking rig but, its going to sit till i can get time to look at it. have a great day to all in the group.

Dave.

as far as I know, tune the radio to a dummy load first, then tune the tuner for antenna to radio..... that way you know you radio is full output to 50 ohm load...

Hello All.

Time to make one shack instead of the two so the 530SP is up for sale.

It is in Excellent working condition . Cosmetically, it is looking great
with a only a few scratches on the paint.

$350 Plus actual shipping. It also comes with a
Shure 550L Desk Mike.

Please contact me if you have any questions.

Please forward this to any interested parties.

Thanks
Ed

Date: 2009-03-15 20:42:08 UTC
From: jsloss
Topic: 20548 Message: 20548

Further to my previous - I need a 10 MHz crystal, not 1 MHZ as stated, for my 820S's digital counter.

Thanks,

Joe k7mks

Topic: 20548 Message: 20549

Maybe could add small pf cap in series or parallel to pull the crystal back into range. Just a thought.

Mike,

If you are replying to my message about low signal, but could receive. When I turn the 25 khz on, Then the meter goes about 3/4 of the way up after tuning the drive stage. But the receive is'nt as strong as it was before.

Thanks
ki0gv

How strong is the 520's calibrator signal?

From: Lewis C Lehman
Topic: 20551 Message: 20551

On an TS-820S, after I have tuned for maximum output, how do I safely reduce output power, in case I wanted to try QRP, or to keep from over-driving an amplifier?

20552. Re: [TS-520_820_530_830] Tuning for Low Power

Yahoo group: TS-520_820_530_830 (2009)

From: Kelly Maiden
Topic: 20551 Message: 20552

One of the best ways is to use an external dc source to drive the alc level. I
use a variable power supply to drive pin 6 on the remote connector negative. (the shell is the plus wire in this case) In CW mode you can watch the output power
drop as you increase the alc voltage. Lower it to the desired level and then switch to SSB mode and
you're good to go.

Hi Lou,
Exactly what should I be looking for when I check this IC?
I am thinking of just removing it and installing a new one and use a
socket instead of soldering it in.
Any problems doing that that I should be aware of?
I have checked all the current limiting resistors, and they all test fine.

Thanks,
Gordon

Hi Gordon,

If you can get access to a 'scope or logic probe, check the segment drive lines to the display. You should be able to find the line that's not changing state. Remember of course that you need to select a frequency on the DFC230 that will illuminate the faulty segment. Page 7 & 8 of the service manual will help you identify the correct line. Otherwise you could just go ahead and replace the chip.

Topic: 20555 Message: 20555

I have had my TS-520s for a few months now and I'm very pleased with it.
(original valves, full output etc.)
After reading of problems the rig may develop over time
I'm considering some preventive maintenance.
I am by trade an industrial electronics repair engineer so I'm reasonably competent
and have all the required equipment.
I don't intend to re-align anything yet, I just want to ensure the rig keeps going as it
is.

I've read in this forum about the finals cathode resistors possibly increasing resistance
What else should I check?

All suggestions appreciated
Thanks ..Sulaiman 2E0YAH

20557. Re: [TS-520_820_530_830] TS-530S& AT 120 tuner /procedures to tune

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-03-15 18:21:46 UTC
From: Aron
Topic: 20544 Message: 20557

Mike,

Here's how I do with my AT-180: (This will probably be applicable to your AT-120)

1) Tune the driver for max noise in the RX - with the antenna
2) Switch over to dummy load on the ATU
3) Dip and load the plate by the book (on dummy). Mic gain/ Carrier - by the book.
4) Switch over to the antenna on the ATU
5) With the ATU meter position in SWR, tune the ATU for least deflection
6) Reconfirm the least deflection once again after calibrating the forward deflection to FSD
7) Switch over the ATU meter to indicate power
8) Touch-up the drive control (TS-530S) for peak o/p

The above procedure looks long but shouldn't take more than 15 to 30 seconds.

The others in the group may have a better method. I'm all ears. ;-))

Cheers and 73,
Aron.

Thanks Lou,
The segment that is out is the (e) segment which is pin 11 on IC16 if I am correct.
Do I check the Cathode (pin 11) or do I check the Anode of each Digit?
I am a newbee when it comes to digital display logics

20560. Re: [TS-520_820_530_830] DFC-230

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-03-16 02:26:02 UTC
From: Lou Blasco
Topic: 1151 Message: 20560

Hi Gordon,

If segment e is off I think the correct pin on IC16 is pin 9 (check page 8). Check pin 9 of the IC and note activity on that line. I expect a working line to change between 0V and 5V depending on weather the segment is lit or not. It should be enough to show you that the cathode is being driven. If you like you could used the anode line from one of the digit driver transistors to trigger the scope doesn't matter which as long as you know which digit you are watching. Knowing the state of the segment on your chosen digit you should be able to figure out what's going on.

A bit hard to explain briefly in an email but here goes. Q20 to Q23 drive each digit in turn to 5 Volts. As each digit is enabled IC16 drives each segment to be illuminated to 0 Volts. So in order to display an "8" all segments will be drive to 0 volts. In order to display a zero all segments except "g" will be drive to 0 volts. If you trigger off any one of the four transistors you should be able to probe pin 9 to pin 15 of IC16 and see the state of each segment line. I'm pretty confident from your description that you will see very little or no activity on pin 9 of IC16.

The problem you describe points to IC16. Use the scope to watch pin 9 to pin 15 of IC16 and I'm confident you'll see the problem. Of course, if you have the parts it might be quicker to replace IC16 and check the results

Good luck

Lou

Topic: 1151 Message: 20562

Hi Lou,
you are correct. I was looking at the terminal (pin) numbers for the Display unit itself. The pin on IC-16 is Pin 9 like you stated.
I will take a look at the lines tomorrow on the scope and let you know what I see.
If the IC-16 is available at my local parts store, I might just replace it and see what happens. The IC is pretty cheap. Not sure where I would find the LED display Chip (LN543GA) though. Seems it is discontinued. The DFC-230 works great except for those segments that are out.
I will keep you updated and thanks again Lou!

73,
Gordon

Hi Mike,
I think that the springs you talk of are the wire wrapped lead connections. It's soft wire so just tease out a bit of the wire with a small screwdriver and unwrap it with a pair of thin nose pliers. You'll need a wire wrapping tool if you want them back the same. I'm sure someone will shout at me for this but I solder mine back.
Don't forget to ground everything to chassis before you start.
Chris

20564. Fixed Channels and Mic ad Stablizer

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-03-16 06:45:15 UTC
From: blacklabpupp
Topic: 20564 Message: 20564

I hate to ask so many questions, but where do the fixed crystals go? I searched the board again today and I cant find it. Also what type of crystals are to be installed? The common FT 243 that you see on eBay about every day? I am still puzzled about alot of this.
Has anyone installed the K4DPK stablizer? I am about to try one out and see if it will stablize the freq drift I experience. I can monitor the TS 820 on my Yaesu and I notice some drift. I realize this is normal considering the age and design of the gear. But the site claims it can hold the drift to more usable levels.
Mic's are a common argument on air, but generally what is best for this type of gear? Dynamic or magnetic, crystal. I dont usually worry to much with audio, but the hand mic that came with the rig is not of much use. All the best Gene

Think it depends on the set, but on the TS520 the crystal board is at
the top just behind the VFO.

My TS520 drifts pretty badly for the first five minutes, but after that
it's stable to about 100Hz/hr. After it's been on for an hour or two,
it's good for a few tens of Hz per hour. Sudden drastic changes in
ambient temperature will knock it off, so you'll need to retune a bit if
your shack gets really hot or really cold when you're using it.

> Mic's are a common argument on air, but generally what is best for

I use the MC-10 hand mike, and found it to be pretty good. I don't have
a lot of space in the shack for a desk mike, and I can't be bothered
with all the preampery and bracketry involved in mounting a "studio"
mike. The audio from the MC-10 should be perfectly okay, but it's
possible that yours is faulty or damaged. One thing to make sure of is
that the case is screwed together properly - if it's not, it will creak
and groan as it flexes when you press the PTT and will sound really
horrible for your listeners!

You can use just about any mike as long as it has a high-impedance
output. If you've got a low-impedance mike, you'll need a preamp of
some sort. You can buy these, or you can make these. At its simplest,
it's one transistor, two resistors, two caps and a battery. Not exactly
difficult, is it?

I don't really get the whole "studio mike" thing for this kind of work.
The very first thing that happens to your audio when it goes into the
TS-(whatever) is it's passed through a clipper, lowpass filter to lop
off everything below 300Hz, then a highpass to lop off everything above
3400Hz. For a speech mode that sounds like an angry duck trapped in a
tin outhouse, having a really high-end mike seems a bit unnecessary.

The fixed crystals for the TS-820 plug into the FIX CHANNEL board on the bottom. The crystals are HC-25/U and frequency ranges between 5.00Mhz and 5.500Mhz. See the TS-820's operator's manual page 21 for further details. You can download the TS-820 operator's manual at the following Kenwood website.

http://www.kenwoodusa.com/Support/AMA_Radios/#_

Scroll down and click on the "Amateur Radio Manual" drop down menu.

Drift in the 820 is caused by the 9VDC drifting upwards. D5 and Q7, when replaced, will greatly reduce the 820's drift after 30 minutes warm up. D5 and Q7 can be obtained at Electronic Surplus.

Q7 (2SA496Y)

http://www.electronicsurplus.com/ccp78762-to-220-pnp-transistor-2sa496-y-13844.htm

D5 (1N5234B, 6.2 volt zener 500 mw)

http://www.electronicsurplus.com/commerce/catalog/product.jsp?product_id=90605&czuid=12335
08037287

I purchased both components from Electronic Surplus (minimum $15 order), replaced D5 and Q7, adjusted the 9VDC and 3.3VDC and my 820's drift, after 30 minute warm up, was no more than 75Hz per hour after 30 minute warm up.

I cracked the case, I see the IF board referred to in the survival guide, but I am unsure as to where to provide an alternative ground. Should this go from one of the screws that mount the board, or do I have to find a ground trace on the board and provide a ground at that point?
Good thing I opened it up, my band switch was loose as well. Thankfully it was not cracked.

Sir. I have a very nice set of 599s. However the Rec has developed a bit of a problem. I have to run it on 12 volt DC. The internal AC has become inop. I was told it was the AC transformer by a Tech, but said he did not know where he could get a new transformer for me. Any help on this would be much appreciated.

It wasn't me that was having stability problems, it was blacklabpupp ;-)

Seriously though - my TS-520 seems almost supernaturally stable, for an old VFO rig. I put it down to "they don't make 'em like that any more", but is mine just particularly good or something?

Hi Lou,
I fired up the scope and took a look.
Pins 10 through 15 all have the same pattern but as you thought, pin 9
has a very low pattern.
I'm off to see if I can find a new IC.
I'll let you know the outcome after I get it installed.
Thanks.

I have never used the board in question so I can't comment on it. However, I can say that replacing D5 and Q7 on the 820's AF Unit board fixed the drift problem in my 820. A few dollars for a couple of "original" components is, in my opinion, a better route to take than spending quite a bit more for a board that may or may not solve the drift problem. The VFO in the 820 will drift but the drift can be reduced quite a bit, much closer to factory specifications, by replacing the aging D5 and Q7 components with NOS original components then adjusting the 9VDC and 3.3VDC on the AF Unit board.

Of course it's up to Gene whether he goes with a stabilizer board or simply replace the two components on the 820's AF Unit board.

Ok, Did some more testing on this DFC-230.
Looks like it is in fact the Display.
Lou, I removed the output ends of resistors R111 and R112 then switched them. The E segment driver will light up the new segment "D" so that tells me the chip is working. However, the driver that used to be for the "D" segment, still does not light up the "E" segment which tells me, the display is bad.
Do you agree?

73,
Gordon

Hi Gordon,

Unfortunately I have to agree with your assessment, looks like the display is bad. I've never seen an LED display fail unless it's been mistreated which is very unlikely in your case. Is it possible there's a short on the board somewhere? I guess you can either leave it as is or try and find a surplus clock that has the same display.

After a brief search I found that the displays are still available, not sure if it's in the right price range

Thanks for the Link Lou,
I just ordered the display unit. Came to around $45.00 with tax and
shipping. Not that big of a deal.
Hope it solves it. I don't have any history on the unit I am working on.
It came included in a package deal I made.
I checked the Circuits for shorts, but all looks good right up to the
display LED itself.
I appreciate all your help on this thing.

Hi Gordon,

No problem it's just a shame that it wasn't so easy to fix. I think
we've covered all bases now it has to be the display.

Let us know how you go.

Lou,
Yes, I was hoping the chip would fix it, but look at it this way, Now
I know how to partially trouble shoot a display.
So, it was a cheap price to pay for some knowledge that I am sure will
help me down the road, thanks to you!
I will definitely give you an update once the display unit arrives.
I love fixing this old gear and I hate to say something is not fixable!!

Hi Guys. After warm-up my TS-530S drifts about 80 HZ an hour. My
TS-130SE only drifts about 37 HZ after warm-up. This is well within
specs for both radios. Both radios are stable enough to use for PSK
and other sound card digital modes.

If it were me, I would replace a few parts rather than try an more
expensive and complex solution.

Running some further tests:

HV - starts at 950 then backs down to 800

IP - runs the gamut (In tune it will go negative)

ALC - solid right hand peg on the meter

RF - up and down and all around

Looks like I'll have to tear the PA compartment apart.great

Gordon & All,

I hope this finds you well. In the interest of giving you a little peace of mind... I've purchased parts for my Kenwood gear through Parts Store and found them to be reliable and prompt. You can even type in the original K-wood parts #'s or board assy. #;s and find the part you need.

I found in one case, the X59-1100-00 board complete was much cheaper than the SMD's that I needed to replace & a lot easier to replace as well.

I hope this helps.

Well problem solved:

After digging around and checking resistors and voltages it turns out that there was a cold solder joint on the parasitic suppressor connecting the front 6146B to the plate choke. Once that was resoldered the old girl was good to go. Everything seems happy now including the owner.

Pumping out 135W solid on 20m into my cantenna and no tube changes. While the old girl is apart I'll do some cleaning and aligning maybe.

Thanks to folks for suggestions.

20589. Fixed Channel Operation

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-03-17 07:30:38 UTC
From: blacklabpupp
Topic: 20589 Message: 20589

Thanks for sending me to a URL to download the manual. I had no idea Kenwood would offer it.
Let me see if I have this right. The TS 820 will work on 30, 17, and 12 meters, using the fixed channel mode?
I know someone has already figured this out, but lets give it a go and see if I understand it correctly. The fixed channel on transmit will only be that one frequency, but on receive I can use the RIT and listen to the whole band, on either 30, 17, or 12, because they are under the 150 khz range of the RIT. But without an external VFO I am stuck on one transmit freq. So to figure the crystal needed, following the formula in the manual, 5.5 + 10 - 10.125 = 5.375. So I should order a crystal for 5.375 Mhz. Because the crystal is operating on a harmonic all I need to do is tune the Plate into the range of 30 meters, and set the Load and Drive and I am good to go. GOD how I hope so!!!! Gene

20590. Re: Fixed Channel Operation

Yahoo group: TS-520_820_530_830 (2009)

From: w5rkl
Topic: 20589 Message: 20590

Hello Gene,

"Let me see if I have this right. The TS 820 will work on 30, 17, and 12 meters, using the fixed channel mode?"

Unfortunately Gene, that's not correct. The FIX CH mode allows the 820 to be operated on one of the following but only on the "original" band switch settings:

1. Fix crystal control transmit AND receive, no VFO operation. RIT does not work in this mode.

2. Fix crystal control transmit with VFO receive. RIT works in receive.

3. Fix crystal control receive with VFO control transmit. RIT does not work in receive mode.

The FIX CH crystals replace the VFO as a frequency controlling stage depending on what position the FUNCTION switch is set to. FIX CH does not allow you to operate the 820 on any band that is not part of the band switch. That means you can't operate on 30, 17, or 12 meters, by simply installing a crystal in one of the 4 FIX CH crystal sockets. It doesn't work that way.

The AUX position does not provide for transmit, only receive. The AUX position uses a crystal that is installed on the PD Unit of the PLL unit, not the FIX CH crystal sockets. There is no crystal installed in the AUX PD Unit's position as the 820 comes from the factory. You would have to install one but then again, it's only receive without extensive modification to the 820 for transmit and I wouldn't recommend that.

In order for the 820 to operate on one or more of the WARC bands, you would have change one or more of the 820's PD Unit's crystals. If you did that, you would loose what ever band PD Unit crystal you changed. This is how CB hackers modify Kenwood hybrids so they operate on 11 meters. CB hackers "usually" pick on of the 10 meter band switch settings and change the PD Unit's crystal so the radio operates on 11 meters then realign the radio. The final amplifier operating "outside" it's designed band switch setting does NOT like it very much. The final amplifier's PI Network is designed to operate on the "original" band switch settings. Operating "outside" of the original band switch setting can cause problems that could lead to early failures or improper emission radiation due to the circuits not operating at their designed resonant frequencies.

Whether you go to that extreme is your choice but I don't recommend it. If you want to operate on the WARC bands I recommend finding a radio that is designed to operate on the WARC bands, not modify the 820.

> Let me see if I have this right. The TS 820 will work on 30, 17, and 12 meters, using the fixed channel mode?
> I know someone has already figured this out, but lets give it a go and see if I understand it correctly. The fixed channel on transmit will only be that one frequency, but on receive I can use the RIT and listen to the whole band, on either 30, 17, or 12, because they are under the 150 khz range of the RIT. But without an external VFO I am stuck on one transmit freq. So to figure the crystal needed, following the formula in the manual, 5.5 + 10 - 10.125 = 5.375. So I should order a crystal for 5.375 Mhz. Because the crystal is operating on a harmonic all I need to do is tune the Plate into the range of 30 meters, and set the Load and Drive and I am good to go. GOD how I hope so!!!! Gene

What is the plate current and HV reading at 135 watts output into your dummy load and in what mode, CW or SSB?

Hi Mike,

No, I was asking Bob how well he could hear the calibrator/marker signal on his radio.

However, if your radio can hear the calibrator/marker signal quite well but normal incoming signals are weak, you might want to check the antenna relay contacts, they could be quite dirty.

The calibrator/marker signal feeds the coil pack on the receiver side of the antenna change over relay, meaning between the coil pack and the antenna relay, not between the antenna relay and the rear panel SO-239 antenna connection. Check the relay contacts.

Hi Gene. Mike is correct. And the RIT ONLY works on receive, and usually will only move the receive frequency 2-3 Khz at most. There is basically no practical way to get the W.A.R.C. bands (12M, 17M, and 30M) on your TS-820. A TS-530S, or TS-830S will have the W.A.R.C. bands. Or if you prefer solid state radios, a TS-130S, TS-130SE, or TS-430S are radios in about the same price range, and have the W.A.R.C. bands.

So for now, enjoy learning to operate you TS-820, and if you really want the W.A.R.C. bands, save up to add a radio later that has those bands. But keep the TS-820. Its a good well built radio that (with a little TLC) will gove you many years of enjoyment.

If you have an old weak or bad 6146 laying around, remove the glass envelope and tube elements and solder the wires to the pins on the base of the tube for a temporary fix. That's what I did and it works fine until you get the regular plug and cover.

Gene,

The external VFO-820 is used for exactly what you said, split operation but ONLY on the same band. When using the remote VFO-820, all VFO frequency control functions are controlled by the VFO-820's Function switch. The VFO-820's Function switch determines which VFO is used for transmit or receive or whether the VFO-820 controls both transmit and receive frequency control. In the "OFF" position, the VFO-820 is not used to control the 820's frequency, the 820's internal VFO is.

Mike,

Relay RL-2 is the antenna change over relay. RL-2 is located inside the metal box on the bottom of the final. You have to turn the 520 upside down with the bottom cover removed.

With the 520 upside down and the front panel facing you the final amplifier bottom will be in the left rear corner. You will see the band switch shaft connected to a coupling that further connects to a shaft that goes into a small metal box under the final amplifier. Remove the top 3 screws on top of the metal box and remove the top cover. You will see RL-2 inside the metal box.

Relay Rl-1 handles all the other relay switching functions in the 520 and it is located on the left rear under the Marker and VOX boards. Yes, the Marker and VOX boards must be removed to gain access to relay RL-1.

With the top cover removed and the front panel facing you, the Marker and VOX boards will be on the left rear of the 520. Remove both boards and you will see relay RL-1 just forward of capacitors C15 and C16.

There is no quick fix or easy way to work on the relays. Certain boards, hold down screws, and a cover plate must be removed in order to gain access to the relays.

If you don't have the TS-830's operators manual you can download it free at Kenwood website. Go to the following link and scroll down to the "Amateur Radio Manuals" portion. Click on the drop down menu and scroll to and click on TS-830. When you see the word "download" on the page, click download and you'll get the entire TS-830 operators manual in pdf format, free.

Yes, but some of the Manuals from the Kenwood Download site are of very
poor quality.
You can also fond them on my website and i try very hard to get the best
available copies for free download

http://www.k4eaa.com/RL-1.htm

You can buy the RL-1 relay from his web site for $19.95

Subject: [TS-520_820_530_830] Re: Kenwood Ts 520s

Mike,

Relay RL-2 is the antenna change over relay. RL-2 is located inside the metal box on the bottom of the final. You have to turn the 520 upside down with the bottom cover removed.

With the 520 upside down and the front panel facing you the final amplifier bottom will be in the left rear corner. You will see the band switch shaft connected to a coupling that further connects to a shaft that goes into a small metal box under the final amplifier. Remove the top 3 screws on top of the metal box and remove the top cover. You will see RL-2 inside the metal box.

Relay Rl-1 handles all the other relay switching functions in the 520 and it is located on the left rear under the Marker and VOX boards. Yes, the Marker and VOX boards must be removed to gain access to relay RL-1.

With the top cover removed and the front panel facing you, the Marker and VOX boards will be on the left rear of the 520. Remove both boards and you will see relay RL-1 just forward of capacitors C15 and C16.

There is no quick fix or easy way to work on the relays. Certain boards, hold down screws, and a cover plate must be removed in order to gain access to the relays.

From: Tate Antrim
Topic: 20584 Message: 20608

Well.too bad.it's back.

The voltage goes up to around 900 and will fall back to 800. Sometimes it hesitates to go up at all then it will pop right up. This is when it is cold. It seems to stabilize the longer you leave it on. Perhaps it is the caps. They may be taking a bit longer to form their total capacitance due to age? HV will start at 950 and then as power output comes up on the meter the HV falls back to 800.

Plate current at times is off the scale, but when it seems to be working correctly it settles in at around 300 or so at 120W in CW.

It has been on now for about an hour and tonight it is giving me 120W at 14.070 into the dummy load. The 12BY7A is totally too hot to touch at all. I scoped it on SSB with tone input and the drive signal coming off of the drive vari-cap looks pretty good so I'm not thinking it is the driver board that is bad.

I'm leaning towards the HV now.

What is the plate current and HV reading at 135 watts output into your dummy load and in what mode, CW or SSB?

Mike,

Right after I sent you that e-mail I looked at the service manual and it showed how to take the relay's out. I should have looked there first before I asked the question.

I do have the antenna relay out and trying to get the plastic cover off.

Thank's

Mike,

 Right after I sent you that e-mail I looked at the service manual and it showed how to take the relay's out. I should have looked there first before I asked the question.

 I do have the antenna relay out and trying to get the plastic cover off.

Thank's
ki0gv
Mike

Mike,

Relay RL-2 is the antenna change over relay. RL-2 is located inside the metal box on the bottom of the final. You have to turn the 520 upside down with the bottom cover removed.

With the 520 upside down and the front panel facing you the final amplifier bottom will be in the left rear corner. You will see the band switch shaft connected to a coupling that further connects to a shaft that goes into a small metal box under the final amplifier. Remove the top 3 screws on top of the metal box and remove the top cover. You will see RL-2 inside the metal box.

Relay Rl-1 handles all the other relay switching functions in the 520 and it is located on the left rear under the Marker and VOX boards. Yes, the Marker and VOX boards must be removed to gain access to relay RL-1.

With the top cover removed and the front panel facing you, the Marker and VOX boards will be on the left rear of the 520. Remove both boards and you will see relay RL-1 just forward of capacitors C15 and C16.

There is no quick fix or easy way to work on the relays. Certain boards, hold down screws, and a cover plate must be removed in order to gain access to the relays.

Hi,

What is the maximum power I should see on the AT-200 from a healthy TS-520se on CW?

Presently I get an indicated 100W with good reports but the sets way out of alignment and I'm waiting for new tuning slugs before I go any further. On TX, HT is 800 volts and Ip 225mA. Any higher plate current and the power out dips.

Chris

About 100W.

> Presently I get an indicated 100W with good reports but the sets way
> out of alignment and I'm waiting for new tuning slugs before I go any
> further. On TX, HT is 800 volts and Ip 225mA. Any higher plate current

That sounds fairly healthy. What makes you think it's out of alignment?

The anode current increases and the output dips when the output stage is off-tune, because the load presented by the pi network is too light - it's effectively a series-resonant circuit connected to ground, so when it's off-tune it has a very high impedance. The instructions for tuning up are in the manual, but basically go like this:

1) Switch to TUNE mode with a dummy load on, set the CARRIER control to about half-way and the PLATE control to about the middle of the band you want.

2) Set the meter to ALC and then tune DRIVE for a peak (you may need to increase or decrease CARRIER).

3) Set the meter to IP and tune the PLATE control for a dip

4) Set the meter to RF and tune the LOAD control for a peak.

You may need to repeat the last two steps to fine-tune it, especially if your aerial is a bit off-tune - valve PA stages by necessity have a matching network similar to the one in an ATU, to transform the high output impedance from the valves to the low load impedance of the aerial. It also is a fairly high-Q filter so it knocks out a lot of unwanted harmonics, giving a lovely clean signal. Yay for boat anchors.

Gordon

That sounds about right - the HT should be about 950V off-load and about 800V at full power. When you say "power output comes up" do you mean as you increase the carrier control. Silly question, but you're not switching to transmit before the PA valves have warmed up? That would be a bad thing...

> Plate current at times is off the scale, but when it seems to be working
> correctly it settles in at around 300 or so at 120W in CW.

That's not right at all. It shouldn't be off the scale, ever - that indicates a serious overload. Serious like anodes glowing red hot, stripping coating off cathode, expensive noises ensue kind of serious.

The fact that it seems to settle down and work but reads 300mA suggests to me that maybe one of the cathode resistors has died. My TS-520 did some pretty odd things involving the anode current going high and weird output problems. On closer inspection, the cathode resistors were shot - one of them was split open and one of them crumbled into bits when I touched it.

120W seems pretty optimistic. The 12BY7A will get pretty hot, don't worry about that.

Hi Gordon and thanks.
The set was way out of alignment when I got it about 3 weeks ago. The drive knob was off 12 o'clock by varying degrees on different bands and some bands were quite deaf. I found that some of the antenna and IF slugs were damaged and jammed so I've carefully removed those and ordered some slugs from Surplus Sales over there. Meanwhile I've managed to get 20m tuned so I can use it while I wait for the post. On 20m the antenna and if look good and it's pulling signals in ok but the drive isn't as high as it could be that's why I was wondering if there's a little more RF output to find. I'm ok with tuning up the finals but what I was saying was that as I tune and increase the load, I get to 225mA and 100w and then any more increase in load causes higher plate current but a decrease in power out.

The load control is part of the pi network tuning. It's not something
you increase or decrease like a gain control, you tune it for maximum RF
output.

Topic: 20584 Message: 20618

By cold I mean I□ve given the thing 10 minutes or so to warm up. HV starts high and then over time it will drop back to 800 under full load and 850 in tune.

When the plate voltage is high there□s little output power in either tune or CW. After an hour or so if you key it, it won□t hesitate to show you output power whereas before it may take a couple of seconds to show any output and HV is back to 800/850. All the while plate voltage is moving around. Once the plate volage is very stable then it operates fine.

The only thing that really bothers me is the ALC. In tune, ALC is full scale. In CW with full output ALC is a bit more than ¾ scale.

At k4EAA□s suggestion I□m also looking at RL-1 and I□m going to replace the cathode resistors as there is about 8 ohms to ground instead of 4.5 □ 5 which could explain the amount of current I□m reading that seems a bit high □ in fact it would be almost double what is really there. I pulled the PCB in the final cage and inspected each resistor, but 8 ohms would indicate that they□ve all tended towards high ohms over time.

Even when the IP pegged it didn□t appear to result in bad things happening □ no smoke, no bright flashes. Frightening yes, but very strange.

Until you've done that, all bets are off. It's more likely that one of
the resistors is entirely open, but they could *all* be on the way
out...

That reading is *definitely* wrong.

Michael,

I can't comment either way on Radio Shack contact cleaner/lubricant since I use DeoXit. It may be quite good so don't take my answer as to mean it is not good. I also recommend using canned air. You can find it at Walmart for about $5 a can. Using canned air to remove excess cleaner and dirt/dust is essential in troubleshooting.

When cleaning relays contacts, use care to ensure you do not bent or break the relay contacts. I use a thin piece of cardboard, the thickness of a match book cover. You can also use bond paper or paper used in your printer. Simply cut a small piece of paper, fold it over once so it fits between the relay contacts. Apply cleaner to a small piece of cardboard or paper and place it between the contacts, and with a back and forth motion clean the contacts. You may have to do this a couple of times, all depending on how dirty the contacts are. Again, be careful not to bend or break the relay contacts. After cleaning the contacts, flow canned air across the contacts to remove any excess contact cleaner and carbon/dirt from the contacts.

Always follow the caution/warnings on contact cleaner cans. The cleaner is flammable is it only takes a small spark to ignite it.

20622. RE: I have for sale -- All in good condition

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-03-18 16:17:01 UTC
From: Rick
Topic: 20622 Message: 20622

Hi to the group -- Well, it's time for me to modernize so I am going to let these radios slip away. All are in great shape and I would like to find a good home for them... If you are interested please contact me off the group

Ts-820 -- Upgraded to an 820S w/remote VFO
Ts-820S -
Ts-520

The 820s have CW filters, the 520 does not --

Trades and price to be discussed

Thanks -- Rick NU7Z

Tate,

I agree with Gordon, replace all 4 of the final tube cathode resistors, R2 thru R5, with new 20 ohm 1/2 watt resistors.

300ma plate current in the final tubes is way too high! Continued operating the 830 at this high current level will not only cause early tube failure but it can easily result in power supply failures which could lead to failures in other components/circuits as well.

At this point and based on your comments about the cathode resistors, I disagree with your idea the problem is the HV supply. Replace all 4 of the cathode resistors then check for final amplifier stability. Only then if the problem continues would I agree to check the power supply or other areas for the source of the problem.

Hi Guys. I have made the grave error (in the past) of using Radio shack TV tuner cleaner with lubricant, and Radio shack Contact cleaner with lubricant. The lubricant seeped across circuit boards (even though I was using only a very small amount of cleaner) caused problems. It required several risnigs woth alcohol, (with appropriate periods for everything toi dry) to get rid of the lubricant.

I can only recommend DeOxit D5 for cleaning contacts and controls.
And use as little as possible to do the job.

TTYL

w5rkl wrote:
> Michael,
>
> I can't comment either way on Radio Shack contact cleaner/lubricant since I use DeoXit. It may be quite good so don't take my answer as to mean it is not good. I also recommend using canned air. You can find it at Walmart for about $5 a can. Using canned air to remove excess cleaner and dirt/dust is essential in troubleshooting.
>
> When cleaning relays contacts, use care to ensure you do not bent or break the relay contacts. I use a thin piece of cardboard, the thickness of a match book cover. You can also use bond paper or paper used in your printer. Simply cut a small piece of paper, fold it over once so it fits between the relay contacts. Apply cleaner to a small piece of cardboard or paper and place it between the contacts, and with a back and forth motion clean the contacts. You may have to do this a couple of times, all depending on how dirty the contacts are. Again, be careful not to bend or break the relay contacts. After cleaning the contacts, flow canned air across the contacts to remove any excess contact cleaner and carbon/dirt from the contacts.
>
> Always follow the caution/warnings on contact cleaner cans. The cleaner is flammable is it only takes a small spark to ignite it.

Subject: [TS-520_820_530_830] TS-520SE Indicated power

Hi,

What is the maximum power I should see on the AT-200 from a healthy TS-520se on CW?

Presently I get an indicated 100W with good reports but the sets way out of alignment and I'm waiting for new tuning slugs before I go any further. On TX, HT is 800 volts and Ip 225mA. Any higher plate current and the power out dips.

20628. RF and Grounding

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-03-19 03:24:30 UTC
From: Gmail - Kevin, Natalia, Stacey & Rochelle
Topic: 20628 Message: 20628

Hi All,

Not exactly just related to this group, but the incient happened when using my TS-830.
I was in the process of tuning my radio up and got a nice RF shock from the mic socket, had just flipped to the TX/RX switch TX.
I do know there is a little SWR on the antenna, but it is still below 2:1.

I have not got around to connecting the earth cable I installed when I build the radio shack.
Which brings me to my question.
The earth cable I have is connected to the house earth, to the earth stake outside.
I read somewhere that it running 2x earths could cause earth loops?
So here I am about to connect this earth to the radio shack wall to connect all my radios.
Am I about to do the right thing, or should I install a seperate earth just for the radios?

My concern is, if there is any RF coming back to the radio and then hopefully down the earth, would it effect or get into any of the house-hold appilances that are inside. (We run 3x wires, Phase, Nautral and Earth at 240VAC)

Regards for any Advice.

Kevin, ZL1KFM.

Well back to the group again. I'm still having low receive, I took the relay'as out cleaned them. While I was looking at the RF board, I experimented and took the FET transistors out one at a time turning the radio off and back on each time, Well all them made a difference until I took Q 1 out and it didnt make any difference weather it was in or out of the board. I looked up to see what it affected and it's an amplifier transsitor for both Receive and Transmit. So shouldn't it make a difference on the receive part? And next question where can you get a replacement if it's defective.

Thanks

From: w5rkl
Topic: 20629 Message: 20630

Mike,

Q1 on the RF Unit is the transmit mixer and is not part of the
receive signal path.

The 520S has a variable IF frequency that is between 8.295Mhz and
8.895Mhz. This signal, in receive, is called the "RIF" frequency
(Recieve IF). In transmit, the signal is called the "TIF" frequency
(Transmit IF), both within the same 8.295Mhz to 8.895Mhz range.

Here's an example of how an incoming 80 meter 3.500Mhz signal flows
through the RF amplifier, mixed in the first receiver mixer, and then
passed on to the IF Unit. The same process occurs on each band but
the selection of the mixer's output frequency, SUM or DIFFERENCE,
depends on the band. The ultimate mixing process MUST produce a
frequency between 8.295Mhz and 8.895Mhz.

An incoming 3.500Mhz signal is amplified by RF amplifier Q3 then fed
to the receiver's first mixer, Q2. The incoming signal and the local
oscillator signal, Q6 and Q7, are mixed in Q2 producing a SUM, and a
DIFFERENCE frequency. Since the desired signal must be between
8.295Mhz and 8.895Mhz, and the local oscillator signal is 12.395Mhz,
the mixer's output "DIFFERENCE" frequency is used which produces a
signal of "8.895Mhz", the RIF frequency (12.395 - 3.500 = 8.895Mhz).
The 8.895Mhz signal is then passed to the IF Unit for further
processing.

20634. Re: TS-520S Incoming signal flow and Q1 on the RF Unit board

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-03-20 03:18:17 UTC
From: w5rkl
Topic: 20631 Message: 20634

Hello Mike,

Bad RF and AF controls can be easily determined by simply rotating them. Rotating the RF gain control counter clockwise and clockwise should cause the S meter to rise and fall with any irregular meter movement. Rotating the AF gain control both ways should cause the audio to increase and decrease without popping or scratchiness. If both controls do not exhibit scratchiness and/or irregular meter movements, then the controls are fine. Any irregularities and/or scratchiness, clean the pots with contact cleaner. More often than not, RF and AF gain controls do not fail, they usually only get dirty.

I can't say for sure whether your 520S requires an alignment or not. There is one thing you can do and that's to measure and, if necessary, adjust the 3.3VDC and 9VDC pots on the FIX CH AVR board. You should have the 520S service manual when performing any maintenance on the 520. If you don't have the service manual, you can download it free at the following website.

http://www.n6wk.com/kenwood/

Scroll down the page and click on TS-520S service manual. You will need the Adobe reader to view the manual.

Once downloaded, click on the manual's icon in the folder you save it to and when Adobe loads the manual, go to page "16". This page shows the FIX CH AVR board which will help you locate the terminals you will need to connect your volt meter to, to set the 9 and 3.3 volts.

The FIX CH AVR board is located directly behind the VFO on top of the chassis.

Adobe page 14 shows the top and bottom of the 520S and where each board is located by name and board number. The FIX CH AVR board is X43-1100-00.

To help you, use a digital volt meter and connect the red lead to terminal "9" on the FIX CH AVR board and the black lead to chassis ground. Locate VR1 pot on the FIX CH AVR board and if necessary, adjust VR1 so the volt meter reads 9VDC, +/- .1VDC.

Move the red lead to terminal RF1 on the FIX CH AVR board and again, if necessary, adjust VR3 on the FIX CH AVR board so the volt meter reads 3.3VDC, +/- .1VDC.

Adjust the 9 volts (VR1) "first" then the 3.3 volts (VR3).

Recheck both voltages and adjust accordingly.

Let the 520S warm up for approximately 30 minutes before performing the voltage checks and adjustments. This allows the 520S to warm up to operating temperature.

20635. RE: [TS-520_820_530_830] question re ts 830s

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-03-19 23:59:41 UTC
From: Garrett, Russ
Topic: 20632 Message: 20635

I just purchased a ts 830s and have opened it up, checked it out and it's nice and clean. Serial number is over 1 million but below 2 million.

The XF1 8.83 mhz filter 2.7khz bandwidth has been replaced by what appears to be a Collins 8.83 mhz with a bandwidth of 2.1 Khz.

The optional 455 khz CW filter has been installed with what appears to be a Collins 455 khz with a bandwidth of 300 hz. (there is tape over the filters so I cannot determine the mfg but they are not trio-kenwood filters as they wouldn't fit into the pre-drilled holes and are larger)

Observations: when the radio is in SSB mode and the audio output is observed with an audio spectrum analyzer, the radio operates correctly as outlined in the specifications of the KF1 Collins filter with a lower cut-off frequency of approx 60 hz and an upper cut-off frequency of 2.1 Khz. This is true for both upper and lower sidebands and the radio operates correctly.

Problem: IN CW mode, which is using the narrow Collins optional cw filter with a center frequency of 455 Khz and a bandwidth of 300hz, the lower cut off frequency is observed on an audio spectrum analyzer is about 150 hz and the upper cutoff frequency is about 450 hz which is too low for the cw to zero beat with the intermediate audio tone oscillator. However, If I use the IF Shift, I can move the center frequency of the cw filter to 800 hz and then the radio operates correctly and zero beating can be achieved.

Question: what adjustment should be made so that the cw filter will be centered at 800 hz and the IF shift can remain in the zero position?

Thanks

Russ kd7mpk

20637. 25 kz Cal

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-03-20 20:54:20 UTC
From: blacklabpupp
Topic: 20637 Message: 20637

I have never used one but what is the proper way to use the 25kz Cal? When I set it up I hear noise all around it marker. What is the determing factor where it should be set? To me the manual is not all that clear about it. Is the marker sound to be beat with the side tone? Also when the band switch is on WWV, what is it that I am looking for? All the best Gene

Gene,

The 25Khz marker is used to calibrate the dial at even 100Khz dial setting plus ever 25Khz.

WWV is the National Bureau Of Standards time. Their transmitters operate on various HF frequencies from 2.5, 5Mhz, 10Mhz, 15Mhz etc.

JJY on the band switch is the Japanese equivalent of WWV. Unless conditions are good you most likely will not hear JJY but rather WWV.

The Kenwood Hybrids have a "JJY" band switch setting that tunes from 15Mhz to 15.500Mhz. Turn on the Marker, set the band switch to JJY, and tune the dial to 15Mhz. The Marker signal and WWV should zero beat at the same point on the dial. If the Marker zero beats at a slightly different dial setting, zero beat WWV then adjust the Marker adjust capacitor inside the radio so the Marker and WWV zero beat at the same point on the dial.

Sounds like the CW carrier generator frequency is slightly off frequency.

The alignment procedures for the TS-830 are covered in the TS-830 service manual which you can download at the following website.

http://www.n6wk.com/kenwood/

Scroll down and click on TS-830S/M Service Manual. The manual is in pdf format so you will the Adobe reader to view the manual.

While you are at it, download the high resolution TS-830 schematic, it is a great addition to the service manual. Scroll down until you find the TS-830 high resolution schematic from K4EAA then click and save it to a folder on your computer. It will come in handy especially since it is color coded voltages and signal paths etc.

Turn the calibrator on, and every 25kHz you'll hear a very very loud carrier - that's the calibrator.

Now, what you do is you switch on the calibrator, tune for zero beat (the pitch of the whistle from the calibrator drops to nothing) and set the slippy dial on the VFO knob so that the 0 (or 25kHz steps) marker points to the USB or LSB marker beside the knob, depending on what mode you're in.

So, you tune to 14.075MHz, with the calibrator on you tune the VFO for zero beat, and then slip the outer dial round so that "75" lines up with the "USB" marking on the right.

It's all in the manual ;-)

Gordon

20641. Fw: TS-820S Counter Module

Hi Gene,

I think I know what you mean about the 25KHz marker signal. It can be spread about the frequency that you're trying to calibrate and it's worse on some bands than others. As well as listening to the tone, peak the S meter. Also if you use it in cw mode you can listen for the zero beat. I've compared the 520se tuning with the digital readout on an ic-735 and I don't need a digital display. I'm surprised at it's accuracy.

Chris

Okay, describe what exactly is happening when you try it.

With the calibrator switch on, you should hear a loud carrier every
25kHz. Turn the RF gain all the way up and disconnect the aerial so you
don't get distracted by other signals, for now, and tell us if you hear
a regular "whooop whooop whooop" as you spin the dial...

Gordon

Hi Mike,

I've decided to take the radio back to the place where I purchased it. They have a tech. there that is available on Saturdays and I spoke with him this past saturday and he said it sound like something just quite working (I know that). I can't find the cause and I don't have the test equipment to trouble-shoot for the problem. I really appreciate all the help you give me along with all the other's in this group. I will get back with the group to let everyone know what the problem was.

Thanks
ki0gv

Hi Mike,

Sounds like the tech had no idea what was wrong. Maybe because he is not familiar with Kenwood hybrids.

Did you say the Marker/Calibrator signal was quite strong but you could not hear any incoming signals? If that's true, check the rear panel's REC ANT switch, it should be placed in the "NORMAL" position. The "REC ANT" position is for a separate receive antenna connected to the EXT REC ANT connection which is not the same as the antenna connected to the rear SO-239.

Hi Everyone
I have a question that may be a little bizarre. I bought a SB-201 amp about a year ago and now am just getting around to setting it up to use. It had the Soft Key mod done and now I want to use it with a Kenwood TS-520. The question is, can I use the amp with the Soft Key mod or should I remove the mod and use it with the
original wireing? As I understand it the mod reduces the keying voltage to use with the modern sets. Will it still key the older sets??

Thanks
Gary KE7KPI

Mike,

I just checked the antenna switch and it didn't seem to make any difference wheather the switch was normal or rec. ant. the receive stayed the same. As far as the marker goes when I tune it on the 80 meter band it goes about 2/3 of the way up the meter. I don't know if that is the normal position for it or not.

Thanks

Mike,

If the Marker/Calibrator signal produces a two thirds S meter reading then I do not believe you have a problem on the RF Unit board.

Have you checked the rear panel's X-Verter switch? It should be in the "OFF" position. A portion of the X-Verter switch is in the incoming signal path and if the X-Verter switch is in the "ON" position the receive signal path from the antenna to the input to the RF Unit is "open" and will not allow any incoming signals to flow to the RF Unit. The Marker/Calibrator signal does NOT flow through the X-Verter switch.

Gary,

The 520 uses a set of relay contacts for amplifier T/R relay control. You do NOT have to remove the soft key mod, leave it alone.

The Soft Key mod for the SB-200 and SB-201 amplifiers is to allow transceiver's with low voltage open collector switching circuits that would otherwise be destroyed without the soft key mod or an external switching circuit between the amplifier and the transceiver.

Again, you should not have to remove the soft key mod when using the SB-201 with your 520.

20656. TS-520S Incoming signal path simple tests

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-03-24 13:31:43 UTC
From: w5rkl
Topic: 20656 Message: 20656

Mike,

If you have an ohm meter then you can use it to determine if a break in the signal path from the rear panel SO-239 and the input to the RF Unit exists. To perform this ohm meter/continuity test, disconnect ALL power to the 520S and allow the power supplies sufficient time to bleed down to zero volts.

Remove the top cover of the 520S. The RF Unit board is on the right between the final amplifier and the front panel.

Looking down on the RF Unit board, between transformers T6 and T7 and the driver tube (12BY7) locate the "ANT" connection. The "ANT" connection is between transformers T6 and T7.

Connect one lead of the ohm meter to the RF Unit's "ANT" connection and the other ohm meter lead to the rear panel's SO-239 center connector. You should see continuity, a low resistance reading.

If the ohm meter does not indicate continuity then there is a break in the signal path some where along the path from the RF Unit's "ANT" connection and the rear panel's SO-239 center connector. This could be caused by a switch on the rear panel in the wrong position such as the "X-Verter" switch (should be in the "OFF" position), a broken wire, bad relay contact (RL-2) or a bad switch.

If, however, the ohm meter shows continuity but the resistance is 470 ohms or slightly higher and ALL switches are in their normal positions then the RF ATT push button switch is stuck in the pressed position. The RF ATT switch, when pressed, inserted a 470 ohm resistor in the signal path from the SO-239 and the "ANT" connection on the RF Unit.

The next test requires power to be applied to the 520S in receive mode ONLY!! Use caution when making connection to the RF Unit's "ANT" connection. DO NOT at any time key the 520S with the PTT microphone button, CW key, or the front panel SEND switch!!

Another simple test will attach a jumper wire from the RF Unit's "ANT" connection and the center conductor of your antenna's coax cable. If after installing this jumper the receiver comes to life, you can be sure there is a break or bad connection between the RF Unit and the rear panel's SO-239. The bad connection can be a bad switch (REC ANT, X-Verter, or RF ATT), broken wire, or bad relay (RL-2) connections. Trace the wiring until you find the broken or bad connection.

Mike,

I just performed the continuity test between the "Ant" post and the center of the pl-239 and there is no continuity (open). So now I have a Place to start looking. The other test you were talking about, I take it, With the radio on, put a jumper between the "Ant" post and the Pl-239 connection and the receive should come back.
Also when I was checking the continuity, The "Ant" post has full continuity to the frame of the radio. Wired grounded some place?

Thanks

Mike,

Since there is no continuity between the RF Unit's "ANT" connection and the rear panel's SO-239 center connection then check the X-Verter switch, it may be in the wrong position.

Yes, connecting a jumper wire from the RF Unit's "ANT" connection and the center conductor on your antenna's coax should make the receiver come to life and you should hear signals. You will have to adjust the DRIVE control to peak the receive signal. DO NOT key the 520 when adjusting the DRIVE control! Try the jumper and see what happens with the receiver.

You said you have a short between the rear panel's SO-239 center pin and the chassis. What happens to the short when relay RL-2, the relay under the final amplifier inside the metal box, is removed?

Mike,

You're use of the term "PL-259" is incorrect when referring to the antenna connector on the rear of the 520.

The antenna connector on the rear panel of the 520 is called an "SO-239" and it is a "female" connector.

The antenna or tuner coax cable connector that plugs into the 520's rear "SO-239" is called a "PL-259" and it is a "male" connector.

It's important to know the difference when referring to these connectors.

From: Michael
Topic: 20656 Message: 20662

Mike,

I took the wire off the "Ant" post on the RF board and the short appears to be in the board itself showing full continuity from the "Ant" post and chasis ground. And after removing the wire and checking the wire itself to the pl-239 showed "Open" no continuity.

Now I'm really wonder what has happened, maybe a shorted capacitor C55 or C56.

Thanks
ki0gv
Mike

Mike,

Since there is no continuity between the RF Unit's "ANT" connection and the rear panel's SO-239 center connection then check the X-Verter switch, it may be in the wrong position.

Yes, connecting a jumper wire from the RF Unit's "ANT" connection and the center conductor on your antenna's coax should make the receiver come to life and you should hear signals. You will have to adjust the DRIVE control to peak the receive signal. DO NOT key the 520 when adjusting the DRIVE control! Try the jumper and see what happens with the receiver.

You said you have a short between the rear panel's SO-239 center pin and the chassis. What happens to the short when relay RL-2, the relay under the final amplifier inside the metal box, is removed?

Mike,

You're use of the term "PL-259" is incorrect when referring to the antenna connector on the rear of the 520.

The antenna connector on the rear panel of the 520 is called an "SO-239" and it is a "female" connector.

The antenna or tuner coax cable connector that plugs into the 520's rear "SO-239" is called a "PL-259" and it is a "male" connector.

It's important to know the difference when referring to these connectors.

Mike,

Ok, that's good.

The "short" you see is not an RF short. It's simply the primary winding of L1 on the RF unit. It will show up as a "DC" short when measuring with an ohm meter. Don't worry about it.

The problem is finding where the "open" is between the RF Unit's "ANT" connection and the 520's rear SO-239 center connector.

Did you check the rear panel's X-Verter switch like I said before? The X-Verter switch MUST be in the "OFF" position.

If the X-Verter switch is in the "ON" position this could easily be why you do not see continuity between the RF Unit's "ANT" connection and the rear SO-239 center connector! Check the X-Verter switch before you do anything else.

Mike,

Ok, I just hooked the "Ant" post up to the antenna and There Was My Receive. Thanks a Bunch for that little test, Now to trace down the problem and the X Verter switch is and was in the Off postion when I checked it. With your help I might be able to solve this puzzle!

Mike,

Ok, that's good.

The "short" you see is not an RF short. It's simply the primary winding of L1 on the RF unit. It will show up as a "DC" short when measuring with an ohm meter. Don't worry about it.

The problem is finding where the "open" is between the RF Unit's "ANT" connection and the 520's rear SO-239 center connector.

Did you check the rear panel's X-Verter switch like I said before? The X-Verter switch MUST be in the "OFF" position.

If the X-Verter switch is in the "ON" position this could easily be why you do not see continuity between the RF Unit's "ANT" connection and the rear SO-239 center connector! Check the X-Verter switch before you do anything else.

Hi Guys I've been reading along & wondering if there may be a remote possibility the X-verter mod has been done to this radio, the X-verter mod allows antenna switching via the on/off switch of the tv502 or tv506 transverters.
As long as theres a transverter connected to the radio no problem, but after doing the mod you will need to run a shorting plug if no transverter is connected.
Take a look at the transverter plug from the inside of the rear panel & see if pins no.3 & no.10 are shorted and no.6 & no7 respectively should both have a shorting wire...If they are shorted than never mind, but if they are open then the mod has been done & you'll need to use a shorting plug or keep a transverter connected.

Excellent strategy thus far Mike w5rkl, I do appreciate the education!
73 Doug kc2pcr

heres a few links to images of the mod & plug pinout for reference.

Mike,

That's good, that proved the RF Unit was not nor ever was the problem.

I don't remember whether you said you have the 520S operating and service manuals plus the high resolution schematic or not. You will need these, especially the service manual and the high resolution schematic to service the 520S. Without them you are just stabbing in the dark! Therefore, if you do not have these items go to the following website and download each of them.

http://www.n6wk.com/kenwood/

Scroll down and click on each link, downloading each item to your computer's hard drive.

I recommend you review the high resolution schematic before taking on the task of tracing the signal path. The area of the schematic you need to look at is on the middle and upper right. You will notice the SO-239 with the letters "ANT" directly above it. The heavy dark black line from the SO-239 goes to relay RL-2 then on to the X-Verter switch etc. That heavy dark black line ultimately terminates at the RF Unit board's ANT connection even though the schematic does NOT show "ANT" on the RF Unit board. Believe me, that IS the RF Unit's ANT connection! Pay attention to wire colors as they can lead you to the next "correct" connection. Some wires may have "2" colors, a solid back ground color with another color "strip". Some may have "3" colors, a solid back ground color with "2" different or "2" same color strips. Just pay attention to the wire colors.

If you get stumped and have questions etc, then ask.

One last thing. Pull the power cable from the wall outlet BEFORE attempting any of these steps!!

Hi Doug,

No, there is no need to short any of the X-Verter pins if there isn't a transverter plugged into the rear X-Verter socket. If there is no a transverter plugged into the X-Verter socket then the X-Verter switch MUST be in the "OFF" position. That's what the X-Verter switch is for. Don't be confused by "thinking" something is need when it's not. There is absolutely no need for a shorting plug or shorting of any of the X-Verter pins when nothing is plugged into the X-Verter socket!

Let me rephrase my last response. Normally, if no mod has been done, there is no need for a shorting of any X-Verter socket pins. The X-Verter switch would be in the "OFF" position when nothing is plugged into the X-Verter socket.

If, however, some X-Verter mod which I am not aware of, has been done, Mike will find it when tracing the signal path. That would be the portion where I said if he gets "stumped" then ask.

Hi mike,
My mistake, as you said thats not needed for the 520S...only the 520 when that mod has been done.
I didnt notice the 520 "S" in the topic.
enjoy the day- doug

20671. TS-830S drifting

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-03-25 23:08:55 UTC
From: Gordon
Topic: 20671 Message: 20671

Thought I would share this with the group.
I am aligning a TS-830S here on the bench. I adjusted the 9 volt and 3.6 volt supplies. However, on cold start up, the Frequency would drift about 200hz.
So, I decided to monitor the 9 volt line when turning the Radio on. I found that it varied considerably. So, I loosened and re-tightened all the screws on the AF/AVR board and as soon as I did, The 9 volt line became ROCK solid and now there is No more drift and no more Voltage fluctuation.
I just wanted to share this with all your guys. Simple Fix.
I knew about loosening and re-tightening all the board mounting screws, I just want to remind everyone how important and simple it is!

Mike,

I think I have found the problem right off the start. As usual when I start traceing a problem, I check the obvious first, all switches and there wiring etc. Well on the Ant rec. switch for normal or external, I found a loose wire that was hide under the other wires and it was suppose to connect to the Normal side. Now to get to it and solder it back in place. Could I be so lucky. I'm still traceing just in case that doesn't do it.

I will keep you informed.

Thanks
ki0gv
Mike

Mike,

Here's an update on my radio on the receive. The wire that I had found late last night (2:00 this morning) that was loose from the Ant Rec switch. I soldered it back to the center post of the switch (The wire was coming from the RF Att) any way when I turned the radio on at roughly 10:00 P.M. The Receive came back Loud, Like good old summer time condition's on 80 meter's and it has been on steady since and it's 12:45 A.M. now and still perculating. I think with all the help you gave me, I got the puzzle solved. I don't think by any means without your help that I could have got it done. You have taught me a great deal of training and experience.

Thank You
ki0gv
Mike

Mike,

That's good, that proved the RF Unit was not nor ever was the problem.

I don't remember whether you said you have the 520S operating and service manuals plus the high resolution schematic or not. You will need these, especially the service manual and the high resolution schematic to service the 520S. Without them you are just stabbing in the dark! Therefore, if you do not have these items go to the following website and download each of them.

http://www.n6wk. com/kenwood/

Scroll down and click on each link, downloading each item to your computer's hard drive.

I recommend you review the high resolution schematic before taking on the task of tracing the signal path. The area of the schematic you need to look at is on the middle and upper right. You will notice the SO-239 with the letters "ANT" directly above it. The heavy dark black line from the SO-239 goes to relay RL-2 then on to the X-Verter switch etc. That heavy dark black line ultimately terminates at the RF Unit board's ANT connection even though the schematic does NOT show "ANT" on the RF Unit board. Believe me, that IS the RF Unit's ANT connection! Pay attention to wire colors as they can lead you to the next "correct" connection. Some wires may have "2" colors, a solid back ground color with another color "strip". Some may have "3" colors, a solid back ground color with "2" different or "2" same color strips. Just pay attention to the wire colors.

If you get stumped and have questions etc, then ask.

One last thing. Pull the power cable from the wall outlet BEFORE attempting any of these steps!!

20674. Poor receive on TS-520SE

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-03-26 06:00:53 UTC
From: sv0xbq
Topic: 20674 Message: 20674

Thought I'd share this. I've got a TS-520SE that's been a bit deaf on all the bands since I got it a few weeks ago. I put it down to poor conditions until I compared it with my Icom which was a lot better on RX.
I finally chased it down to a dry joint on the RF ATT switch. You could hear the signal being attenuated when you used the switch so it wasn't immediately obvious that this was where the problem was. Re-soldered it and the sets really come alive.

Chris

Mike,

Congratulations!! That's terrific!! I'm glad you found the broken/loose wire.

I assumed you downloaded the operator and service manuals along with the high resolution 520S schematic. If you haven't, may I, again, recommend you download all 3 of them and take the time to read the circuit description section and review the block diagrams. By doing this you will become much more familiar with the way the radio works. You don't have to be an electronics expert. However, by reading these sections in the manuals, when problems do arise, now or in the future, you will have a much better idea where to look.

Again, congratulations on fixing your 520.

It's not a difficult job -- only one board has to
be lifted. Remove the board screws, lift off a couple
holddowns or whatever they call those thingamajigs
that hold the cables in place, and you will find
it lifts and folds back neatly. I,ve done it a few
times.

When you have the covers off, take a good sized roll
of duct tape, and bang the side of the chassis a
couple times. It might just clear a dirty contact
and go back to normal operation. Eventually, though,
you are going to have to physically clean the contacts.

If the bang test works, it may work for a long time, or
a short time. There is no guarantee, but it can save a
lot of work until later. I've regularly fixed any
relay problems on my 520S with the bang test, but I've
also gone in and cleaned it.

20677. S-Meter adjustment

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-03-27 18:30:50 UTC
From: shawnmjones20
Topic: 20677 Message: 20677

Hello to everyone,

I have recently purchased a TS-520 radio. I am a beginner ham and have a question about the s-meter. The meter does not seem to move very much when receiving, even on stronger signals. I do not have access to a RF generator as the manual suggests, are their other methods of checking and or adjusting the meter reading.

Thanks,
Shawn KJ4KNW

check first to make sure:::

swr is ok high swr will reduce receive
check for an attenuator switch, if it has one, and make sure it is off

From: w5rkl
Topic: 20677 Message: 20679

Shawn,

The 520 has a built in Marker/Calibrator that can be used as a signal source. The switch that activates the Marker/Calibrator signal is on the FUNCTION switch. Rotate the FUNCTION switch counter clockwise one position so the FUNCTION switch knob points to the 25Khz position. This turns the Marker/Calibrator "ON". This position is NOT a normal operating position so when you are through using the Marker/Calibrator, make sure you return the FUNCTION switch to the "VFO" position, the knob points straight up (12 o'clock) position.

Tune the main tuning dial to either an even 100Khz dial setting (0, 100, 200, 300 etc) or one of the small tick marks between the 0, 100, 200, 300 dial markings. With the Marker/Calibrator turned ON, you should hear a tone. Adjust the DRIVE control for a peak meter reading. The meter, on 80 and 40, should be 10 to 20 over 9 and slightly less on 20, 15, and 10.

Make sure the RF Gain control is set for maximum RF gain (fully clockwise). The meter should rest at or near zero, left side of the meter. Rotating the RF gain control counter clockwise will cause the S meter to rise which is normal. If the RF gain control is rotated completely counter clockwise the S meter will indicate full scale to the right. Again, this is normal. The normal setting for the RF gain control is completely clockwise, maximum gain and the S meter resting at or near zero.

If you do not have the operator and/or the service manual for the 520 I highly recommend you download them at the following website.

http://bama.edebris.com/manuals/kenwood/ts520/

Since you did not mention your troubleshooting and repair technical skill level I will assume your technical skills are limited. If that is the case I recommend you find a local ham, possibly through a ham club in your area, who has the skills to work on a TS-520.

One more thing. Make sure the JJY / WWV push button switch is not pressed. If the JJY / WWV push button is pressed, the incoming signal will be routed to the RF Unit's "JJY" connection instead of the normal "NAT" connection.

Dave,

The original TS-520 does not have a push button attenuator switch. That didn't come along until the 520S and later models.

Sorry folks, TS 820. I added a display from another rig that was used for parts. I took the radio to the shop and we went through the service manual and we got it back to spec. The radio works fine other wise as far as I can tell. The display was working and then I just noticed it was not working. Gene

Hello Gene,

Clean the connection pins on both the Counter Assembly Unit and the Display Unit with DeoXit contact cleaner. Check to ensure none of the wires to the display tube behind the front panel are broken. Check the voltages on the following Counter Assembly Unit pins.

Pin 4 - 14VDC

Pin 16 - 5VDC

If pin 4 measure zero but pin 16 measure 5VDC, check the connection to the 14VDC source, it may be broken or a poor connection. If pin 4 measures 14VDC but pin 16 measure zero, check the 5V-AVR pins for the following voltages.

Pin 1 - 5V
Pin 4 - 14V

Check pin 2 to ensure it is grounded to the chassis.

If voltage on pin 1 is zero but pin 4 is 14VDC then the MC7805CP regulator chip is bad.

If both pins 1 and 4 on the 5V-AVR Unit measure zero, check the connection from pin 4 to the 14VDC source, it may have broken loose or is a bad connection. Without 14VDC on pin 4 there will be zero voltage on pin 1.

Since you installed the digital display from a parts 820S, I also recommend checking all the connections you made, one may have broken loose or is a bad connection.

From: jsloss
Topic: 20687 Message: 20687

Given: On RX my TS-820S receives weakly w/ S-meter around S4 on 20m for an example. Weak on all bands.

On TX it: 1 Has no ALC w/ Carrier full CW in TUNE or CW and DRIVE tuned for a peak - which is not there. Bias is OK. The last 2 and/or 3 digits of the display change numerals at random when in TX. NO PO.

Known: 14VDC power supply is OK. Both relays are OK - substituted with known operational ones.

I've double checked connectors, hunted for loose screws, etc. I have either one problem effecting both RXand TX or 2 problems with one for RX and one for TX.

I'm overlooking something. What is it?

Hello Joe,

> Given: On RX my TS-820S receives weakly w/ S-meter around S4 on 20m for an example. Weak on all bands.

Check to see if the RF ATT button is pressed or a possible loose wire on this switch. See below about checking and, if necessary, adjusting the 3.3VDC and 9VDC on the AF-AVR board.

> On TX it: 1 Has no ALC w/ Carrier full CW in TUNE or CW and DRIVE tuned for a peak - which is not there.

In CW mode there will be "zero" ALC indication on the meter regardless of the CAR control setting, DRIVE adjust, and level of output.

In TUNE mode, however, there should be an ALC meter indication when peaking the DRIVE control with send switch turned on and CAR control set to approximately 10 o'clock. There should be more than enough RF drive to have a full scale ALC meter indication. Check resistors R5 and R6, both 56K 1/2 watt resistors, on the HV Unit board. If these resistor are bad, have increased in value or opened, there will be no ALC indication or drive in TUNE mode. While you are checking these resistors, also check R1, R2, R3, and R7, also on the HV Unit board. R1 is 100K, R2 and R3 are 680K, and R7 is 12K. Replace any that do not measure up (10% tolerance).

>Bias if OK.

I recommend checking all of the voltages on the Rectifier Unit. HV should be approximately 850VDC in standby. This includes measuring the bias voltage on the Final Unit's "FG" connection.

>The last 2 and/or 3 digits of the display change numerals at random when in TX.

Have you cleaned the "FUNCTION" switch wafers with contact cleaner? The VFO's operating voltage, 9VDC, flows through the FUNCTION switch. Any corrosion on the FUNCTION switch wafer can affect the 9VDC which will also affect the VFO's stability. Also remove the side panel on the VFO and clean the shaft to capacitor frame contact. If this "pivot" point gets dirty and/or corroided, the VFO will be unstable. Also clean the 2 pin power connection on the rear of the VFO plus the VFO output RCA plug, also on the rear of the VFO. See below for instability on the VFO. One last thing. Clean all of the digital display plugs and pins.

> Known: 14VDC power supply is OK.

Did you check the 9VDC and the 3.3VDC on the AF-AVR Unit? If the 9VDC is low then the VFO's stability plus the receiver's operating bias will be affected. The 820's receiver bias is the 3.3VDC on the AF AVR Unit board. See the 820's service manual for checking and, if necessary, adjusting both voltages. Adjust the 9VDC first then the 3.3VDC.

-------Original Message-------

Hello Group,
I thought I will share the following with you.
I had to repair a TS 830 which was ok on Tx but some bands had no display , and, of course, no RX on those bands.
I replaced the PLL board from a known working unit and , it started to work again on all bands,
I put back the old pll board and I noted a funny situation . Every time I switch on , display on some bands would come and others would not. If I switch off and on again after a few minutes ,I would lose display on some other bands and band which were not working would come back to life. It was an erratic fault .
I started monitoring the DCBA band data on connector 2 of the pll and found there were wrong on the bands which were not working.The band data table is on page 4 of the circuit diagram.
I removed the connector from the pll and monitored the incoming data from the respective holes of the plug and to my surprise all data were correct.
Since those data go directly to Q16 IC ...SN74LS163 N, I started to doubt it
I managed to get one from Singapore for 20$ (in Deuch land it was 15 EU) and replaced it . Right away I got display on all bands and the rig was back to service again. Guess the faulty Ic was causing the band data to be garbled. Hope this can be of some help.
Regards
jacky 3B8CF

20699. TS-520 Alignment

Yahoo group: TS-520_820_530_830 (2009)

Gentlemen, I"m trying to fix up an old TS-520 recently purchased by a new ham. Unknown to him, this rig has been put on CB by changing the heterodyne crystals and I think that was all. I can get the rig to work on 80 and 40 with a good 100 watts out. But on 20, 15, and 10 I can hardly hear the calibrator let alone see any sort of reading on the meter. I know that the coils are good because on 40 meters, 4 of the coils are in series and I can see a change if I tweak any of them. But as I go to 20 or 15, I can only slightly hear a change and the level is so very far down. I don't see anything else changing in the circuit except for some capacitance switching out as I go up in frequency. What am I overlooking? Thanks, Jim, K7NCG....

Hello Sir, I have de same problem with a old TS510.
Al the tubes has been changed,by newones. Some C's and R's Has been replaced.
The unit is after alignment, working fine on 80 and 40m band (160watts)
The other bands are very poor RX and TX reason unknown.

Hello Jim,

First thing is to determine which crystal(s) were replaced to modify the 520 to 11 meters. Here is a list of the original 80 thru 10 meter crystals. They all are on the RF Unit board (X44-1080-00).

3.5 - 12.395Mhz
7.0 - 15.895Mhz
14.0 - 22.895Mhz
21.0 - 29.895Mhz
28.0 - 36.895Mhz
28.5 - 37.395Mhz
29.1 - 37.995Mhz

Replace any crystal(s) that are not the original crystal frequencies. Replacement crystals can be obtained for $21.95 a piece plus shipping from International Crystals in Oklahoma City, OK. Check their website at the following link:

http://www.icmfg.com/hamradio-manufacturers.html

Also thoroughly check the RF Unit for the following fixed capacitors either in parallel with, in series with, or both, across each band's coil. Any capacitors that is not the correct value, replace it with the correct value and realign the coil(s). Replacement capacitors can be obtained from Mouser Electronics.

www.mouser.com

20 meters - C3 in parallel with L3 with C7 in series to ground with C3.

15 meters - C4 in parallel with L4.

There are no fixed capacitors in parallel with or in series with any 10 meter coils. If you find a capacitor in parallel with any 10 meter coil, remove it. Don't forget to look at the bottom of the RF Unit board as the CB hacker may have installed capacitors on the bottom of the board, the foil/solder side.

These steps will require the 520 service manual and schematic which can be obtained at the following website.

http://bama.edebris.com/manuals/kenwood/ts520/

Hi Guys. I remember back in 1990 when I was first licensed (as a novice), I had a TS-520 that had been modified for 11M. Two 10M crystals had been changed. I managed to replace them with the correct crystals, and 10M was restored to the correct frequencies. However, another mod had been done. CW mode had been converted to AM mode somehow, and I was never able to figure out how, or how to undo that one.

Does anyone have any idea how that was done, and how to undo such a mod? I am just curious. I do not have that radio anymore, and I am not interested in 11M operation. I was not interested in CW (or AM) mode at the time. It would be interesting to know how such a mod was done, and if anyone came across a TS-520 so modified, it would be useful to know how to restore it to original specs.

From: w5rkl
Topic: 20699 Message: 20705

There are three methods to produce AM from a TS-520.

1. Unbalance the balance modulator to produce some RF carrier in sideband and modulate the balance modulator in either sideband with audio from the speech amplifier. This method is the worse of the two.

2. In addition to method 1 above, bypass the crystal filter.

3. Using the CW mode requires a bit more work. The CW mode's carrier generator produces the root RF carrier signal and it's RF signal level is controlled by the CAR control. Modulation, in this method, is supplied by an external modulator. The output of the external modulator is wired in series with the final amplifier's B+. The final tube screens and plates are modulated in this method. The normal front panel MIC socket nor the MIC gain are NOT used since the modulator is "external" and all audio gain is controlled by the MIC gain on the external modulator. Normal AM RF output is kept between 8 and 10 watts, again by adjusting the CAR control, NOT the front panel's MIC gain.

An important thing to remember is, AM operates at "100%" duty cycle. This means an RF carrier output is transmitted 100% of the time while the transmitter is on the air, with or without modulation! This produces much more heat, higher stress on the final amplifier, and a higher demand on the power supply. A normal sideband transmitter/transceiver is designed to produce an RF output signal only 50% of the time, in USB, LSB, and CW, which places much less stress on the final amplifier and power supply, etc.

Hi Mike. Well, in the TS-520 that I had, the radio's original mic gain and mic socket were used. Also, AM signals were received in CW mode, and no tone was heard on CW signals at all.

I did find a mod on the net, but it seems that someone almost had to re-engineer the CW on the radio that I had. Obviously, someone went to a lot of trouble to modify that radio. A lot of knowledge and work were required that could have been put to better use.

20708. Re: [TS-520_820_530_830] Wiring a MC-60 (8 pin) to a 820s (4 pin)

Yahoo group: TS-520_820_530_830 (2009)
Date: 2009-03-31 05:02:47 UTC
From: martin
Topic: 20706 Message: 20708

Hi Kevin. There is a PDF file of the mic wiring for Kenwood radios
available. The Mic line (the one with the shield wrapped around it,
pin 1 on the 8 pin plug) goes to pin 1 of the 4 pin plug. The shield
(pin 7 on the 8 pin plug) goes to pin 4 of the 4 pin mic plug. The
chassis ground (the wire that was on the center pin of the 8 pin plug
pin 8) goes to pin 3 of the 4 pin mic plug. The PTT wire (pin 2 on
the 8 pin plug) goes to pin 2 of the 4 pin plug.

The other wires on the MC-60 cord are not used. The pin numbers are
marked on the plugs. Sometimes on the front, sometimes on the back,
sometimes both places.

I just made a 4 to 8 pin adapter to connect my Super MC-50 to my
TS-430S. I made the adapter instead of wiring an 8 pin plug on the
mic so I can still use it on my TS-530S, or my TS-130SE if I want to.

I will post a pic of the Super MC-50 in the photo section.

TTYL

Hi,
I am trying to revive an ailing ts-530s that I recently purchased. I'm having a hard time locating a repacement final choke, part no. L-33-0635-05. Does anyone have a source for these? Thanks in advance & Best 73, Phil

20711. Digital Display and Counter

Topic: 20711 Message: 20711

Will the counter and digital display from a 530 or 830 work in an 820? I have several units here to work with. I was quite lucky to be given all these peices but I am only working on one at a time. One I know to be a parts radio. But it all is quite a load to figure it all out. Gene

Spence, let me know if you want to get rid of those DG-5 separate. been trying to find one at a reasonable price.

PS. haven't heard you on in a while but then again my dipole turned into a 160 loop so I don't if I am skipping over you now.

Aaron

From: k2pjw
Topic: 20714 Message: 20714

Hi,
The ts-530s I recently purchased has 111xxxx as the serial number. I thought this radio wasn't manufactured until 1981. This would make it 1979 according to what I know of serial number interpretation. Can anyone shed light on if 1979 is indeed the age of my ts-530s with a serial number starting with 111? Thank You.

I have a TS-530S here on the bench. I have never recalled running into this before. Normally during Receive, you only need to peak the Drive control to peak the received signal. However, on this 530, you must peak the Load control as well. It sure doesn't seem normal to me.
Any suggestions?

Gordon

Gordon,
You are GOOD!
Almost exactly what it was. Someone had bent one of the contacts inside the relay cover so it was shorted.
New Relay and all is well now.

If you do decide to break up the package, I may be interested in the AT-200. I took Bob up on his offer of the TS-520 to replace my TS-520S I lost in the fire a couple of weeks ago, but since I also lost my antenna when the east end of the barn fell, I will likely end up just putting up a long wire, so I will have to find a tuner of some kind. Please keep me in mind. Or if anyone on the group happens to have a tuner you no longer need, please contact me. I'm also in need of an outboard power meter of some type.

John,

After all is said and done and you still do not have a antenna tuner. Drop me a line I am good in the call book and QRZ. I have a MFJ 300 watt tuner that you can have if you want it all you have to do is pay shipping from 08105.

Walt, KA2NJF

Before you replace the tubes check the two 5 ohm resistors under the tube bases. Mine had gone high with age and they didn't look cooked.

I've found an easy way to neutralise the finals is to adjust the neutralising cap until the power out peaks at exactly the same point as the plate current Ip dips. Tune up to full power and note the minimum plate current you can get while adjusting only the drive and then still by adjusting only the drive tune for the max power out. They both should occur at exactly the same drive setting. Keep one hand in your pocket and only use a plastic tool to make the neutralising cap adjustment.
